1970 LIF>NB STITLE Convert LIF1 Byte Count to Nibs
1971 *****
1972 *****
1973 **
1974 ** Name: LIF>NB - Convert Byte Count to Nibs
1975 **
1976 ** Category: FILUTL
1977 **
1978 ** Purpose:
1979 ** Takes the byte count from the header of a line from
1980 ** a TEXT (LIF type 1) file and converts it into the true
1981 ** number of nibs occupied by the remainder of the line.
1982 ** The trick is that if the byte count is odd, and extra
1983 ** byte of padding is added to the line.
1984 **
1985 ** Entry:
1986 ** A(3-0) = Byte count from line header a 16-bit value
1987 ** (note: the 4-nib value read from the file
1988 ** be byte reversed using SWPBYT beforehand).
1989 **
1990 ** Exit:
1991 ** C(A) = Corresponding nibble count
1992 ** Carry clear: (Byte length was EVEN)
1993 ** S8 = Clear (sODD)
1994 ** Carry set: (Byte length was ODD)
1995 ** S8 = Set (sODD)
1996 **
1997 ** Calls: None.
1998 **

**
** Name:      TXTCHB - Chain BASIC Dest File After TRANSFORM
**
** Category:   LOCAL
**
** Purpose:
**   To finish up the destination BASIC file after all TEXT
**   lines have been transformed into BASIC. There are
**   several cases to be dealt with:
**
** End of a Dry Run (always out-of-place transform):
**   If the destination file is on an external medium, a
**   first pass or "dry run" is conducted without creating
**   the dest file, in order to determine its necessary data
**   size. This routine calculates the needed parameters
**   to create the file (see CRTF utility), and stores them
**   in /PARM1 and /PARM2.
**
** End of a Normal Run, Out-of-Place Transform:
**   If the destination file type requires a subheader or
**   Implementation field, it must be properly initialized
**   since CRTF stored a default value in it when the file
**   was created (see CRTF utility). For example, if the
**   destination is a BASIC file, hex value 00000000000F
**   must be written to the header to indicate that the link
**   chain heads have not been computed for this file (file
**   has not been "chained"). If the file is in memory, the
**   the proper link chain heads are computed and written to
**   the subheader. File data, such as links between sub-
**   programs in BASIC files, may need to be updated.
**
** End of a Normal Run, In-Place Transform:

```

```

3524      **      If the source file type had a subheader or Implementa-
3525      **      tion field, it must be removed.  If the destination
3526      **      file type requires a subheader or Implementation field,
3527      **      it must be inserted after the file header and set to
3528      **      the proper value.  File data, such as links between
3529      **      subprograms in BASIC files, may need to be updated.
3530      **
3531      **      End of an Inverse Transformation (Always In-Place):
3532      **      If the source file type had a subheader or Implementa-
3533      **      tion field, it is still there but may need to be
3534      **      updated to reflect the new state.  File data, such as
3535      **      links between subprograms in BASIC files, may need
3536      **      to be updated.
3537      **

3907
3908      ****
3909      **
3910      ** Name:      B->CHT - Finish TEXT File After Xform from BASIC
3911      **
3912      ** Category:   LOCAL
3913      **
3914      ** Purpose:
3915      **      To finish up the destination TEXT file after all BASIC

```

```

3916      **      lines have been transformed into TEXT.  There are
3917      **      several cases to be dealt with:
3918      **
3919      **      End of a Dry Run (always out-of-place transform):
3920      **      If the destination file is on an external medium, a
3921      **      first pass or "dry run" is conducted without creating
3922      **      the dest file, in order to determine its necessary data
3923      **      size.  This routine calculates the needed parameters
3924      **      to create the file (see CRTF utility), and stores them
3925      **      in /PARM1 and /PARM2.
3926      **
3927      **      End of a Normal Run, Out-of-Place Transform:
3928      **      If the destination file type requires a subheader or
3929      **      Implementation field, it must be properly initialized
3930      **      since CRTF stored a default value in it when the file
3931      **      was created (see CRTF utility).  Since a TEXT file
3932      **      has no subheader or implementation field (in memory),
3933      **      this case is trivial.
3934      **
3935      **      End of a Normal Run, In-Place Transform:
3936      **      If the source file type had a subheader or Implementa-
3937      **      tion field, it must be removed.  If the destination
3938      **      file type requires a subheader or Implementation field,
3939      **      it must be inserted after the file header and set to
3940      **      the proper value.  File data, such as links between
3941      **      subprograms in BASIC files, may need to be updated.
3942      **      In the case of BASIC to TEXT, the source file's sub-
3943      **      header must be removed.
3944      **
3945      **      End of an Inverse Transformation (Always In-Place):
3946      **      If the source file type had a subheader or Implementa-
3947      **      tion field, it it is still there but may need to be
3948      **      updated to reflect the new state.  File data, such as
3949      **      links between subprograms in BASIC files, may need
3950      **      to be updated (this is true for BASIC to TEXT inverted
3951      **      back to BASIC).
3952      **
3953      **      Entry:
3954      **      Output buffer collapsed (OUTBS, AVMEMS point to SYSEN)
3955      **      R4(15-14) = FIBW of destination file.  Each line of the
3956      **      source file (including EOF) has been read,
3957      **      transformed, and written to the dest file.
3958      **      The End of Data field in the FIB is set to
3959      **      this new end of file and, if the dest file
3960      **      is in memory, any excess nibs beyond the
3961      **      end of file have been removed from the
3962      **      file chain.  File is now remound.
3963      **      S5      = 1 iff transformation is in place (sTFINP)
3964      **      S6      = 1 iff at end of inverse transformation
3965      **      (sTFINV)
3966      **      S9      = 1 iff at end of dry run (sDRYRN)
3967      **      P        = 0
3968      **
3969      **      Exit:
3970      **      P        = 0

```

4028      *****
4029      *****
4030      **
4031      ** Name:(S) RPLSBH - Replace Memory File Subheader
4032      **
4033      ** Category:  FILUTL
4034      **
4035      ** Purpose:
4036      **      Replaces the subheader of a memory file with the data
4037      **      stored in the output buffer. For external files, write
4038      **      the output buffer data to the subheader area of the
4039      **      file. Does NOT update the subheader length field of
4040      **      the FIB, but for memory files it updates the Data Begin
4041      **      field. If out-of-place transform in memory file, it
4042      **      replaces the old subheader unconditionally with the new
4043      **      subheader in output buffer.
4044      **
4045      ** Entry:
4046      **      R4(15-14) = FIB# of dest file; file rewind.
4047      **      R3(A) = Length of old subheader
4048      **      P = 0
4049      **      S5 = 1 iff In-place Transform (sTFINP)
4050      **      Output buffer contains new subheader
4051      **
4052      ** Exit:
4053      **      P = 0
4054      **      R4(15-14) = File FIB#
4055      **      Carry set:
4056      **      C(3-0) = Error code; insufficient memory
4057      **
4058      ** Calls:      LOCFIL, RPLLI*, FIB#RS
4059      **
4060      ** Uses.....
4061      **      Inclusive: A,B,C,D(S),D(7-0),R0,R1,R2,R3,D0,D1

9      TITLE FREE/CLAIM PORT <831212.1205>
10 17A33 ABS #17A33
11      RDSYMB TIZEQU::MS
12      ****
13      ****
14      **
15      ** Name: FRPORT - FREE PORT Execute
16      **
17      ** Category: STExec
18      **
19      ** Purpose:
20      ** Turn system RAM into independent RAM.
21      **
22      ** Entry:
23      ** DO = PC.
24      ** Jumped on FREE token (PORT not tokenized).
25      **
26      ** Exit:
27      ** Through NXTSTM if no error.
28      ** =eDVCNF if port.dev is not system RAM.
29      ** =eMEM if insufficient memory.
30      **
31      ** Calls: CNFFND, CONF3, FINDWF, FNDDEV, MEMCKL, MOVED3,
32      ** MOVEU3, PDEV+, WIPOUT.
33      **
34      ** NOTE:
35      ** Will not execute if amount of available memory is less
36      ** than (module size + leeway).
37      **
38      ** Detail:
39      ** FREE PORT (P.DD).
40      **
41      ** Algorithm:
42      ** Search RAM table for requested port-device; eDVCNF if
43      ** not found.
44      ** Perform memory check with leeway + (if workfile does
45      ** not exist then oFLSTr else 0). eMEM if not enough
46      ** memory to perform FREEPORT.
47      ** Write zero to size nibble of configuration table entry
48      ** for this device. This informs the configuration
49      ** code that the device was intentionally removed and
50      ** machine should not coldstart.
51      ** If start-of-module >= (AVMEMS) then goto 1.
52      ** Source=(AVMEMS); Dest=(AVMEMS)+modsize; #nibs to move=
53      ** (AVMEMS)-(start-of-module); MOVED3 (move to higher
54      ** memory). Goto 2.
55      ** 1: If end-of-module <= (AVMEME) then goto 2.

```

```

56      **      Source=(AVMEME); Dest=(AVMEME)-modsize; #nibs to move=
57      **      (end-of-module)-(AVMEME); MOVEU3 (move to lower
58      **      memory.
59      **      2: Write IRAM ID (B3DDDDDE) to start of module.
60      **      Zero out rest of module.
61      **      Reconfigure system (call CONF3).
62      **      Exit through NXTSTM.
63      **
64      ** History:

10     TITLE READ Statement Execute <831216.1605>
11     ABS #17BC7
12     *****
13     **
14     ** Name: READ - READ Statement Execute
15     **
16     ** Category: STExec
17     **
18     ** Purpose:
19     ** Implements READ statement
20     **
21     ** Entry:
22     ** DO points past READ token
23     ** P = 0
24     **
25     ** Exit:
26     ** Exits through NXTSTM
27     **
28     ** Calls: TKSCN+,STKCHR,STKCH+,NXTSTM
29     **
30     ** Detail:
31     ** Checks if first byte is a # token and jumps into
32     ** READ# routine if it is. Otherwise, for each
33     ** variable in READ list, the destination address and
34     ** type are determined. The next data item searched for
35     ** as follows. If DATPTR = 0 then it is set initialized
36     ** to PRGMST. If the byte pointed to by DATPTR is not
37     ** a comma token then TOKSCN is used to find the next
38     ** DATA statement in the program. If none is found then
39     ** a "No data" error is generated. Otherwise,
40     ** the data is parsed according to the data type of the
41     ** destination.
42     **
43     ** Expression parse will be called on the data stream.
44     ** If a valid expression of matching type (string/num-
45     ** eric) is found and the next token is either a comma
46     ** or an EOL then the expression is moved onto stack
47     ** and evaluated. If the destination is string and
48     ** either an invalid or numeric expression is found
49     ** or if the expression is not followed by a comma or
50     ** EOL then the pointer is backed up to the start of
51     ** the data field and the data item is parsed as
52     ** an unquoted string.
53     ** Before giving control to expression execute DATPTR
54     ** must be updated to point to either the comma
55     ** following the data or at an EOL.

```

```

Is it a # token
No, then do READ
Yes, the handle READ# statement

Save DO
Set up program scope pointers

Restore DO

Is it an array?
No, then collapse stack
Yes, then set up for first element

Collapse MTHSTK to FORSTK

Copy PRGMEN to D(A)

Read DATPTR
Is DATPTR=0?
No, then okay
Yes, then use PRGMST

Read token
ASCII comma
At comma?

1532      ** Name:(S) pPRTIS - PRINTER IS handler poll
1533      **
1534      ** Category:  POLL
1535      **
1536      ** Type:      POLL
1537      **
1538      ** Purpose:
1539      **      Set up for the PRINT statement and return the address
1540      **      of a handler for the print items.
1541      **
1542      ** Should poll be "Handled" (return with XM=0)?:
1543      **      YES
1544      **
1545      ** Meaning of "Handling" Poll (what does code do if handled?):
1546      **      A handler for the PRINT statement has been provided and
1547      **      its address returned.
1548      **
1549      ** Entry conditions for handler (registers, ST, RAM, etc.):
1550      **      Carry clear
1551      **      B[A] = Poll number.
1552      **      HEX mode.
1553      **      P=0.
1554      **
1555      ** Normal exit conditions from handler if handled (ST, RAM,
1556      ** registers, etc.):
1557      **      Carry clear
1558      **      A(A) is the address of the PRINT handler
1559      **      HEX mode.
1560      **      XM=0.
1561      **

```

```

1562      ** Normal exit conditions from handler if not handled (ST, RAM,
1563      ** registers, etc.):
1564      **   Carry clear (POLL only).
1565      **   HEX mode.
1566      **   XM=1.
1567      **
1568      ** Error exit conditions from handler (POLL only):
1569      **   Not applicable
1570      **
1571      ** Available subroutine levels:
1572      **   4
1573      **
1574      ** NOTE:
1575      **   This poll is issued in the CKINFO routine which is in
1576      **   the process of setting up statement scratch to handle
1577      **   a PRINT/PLIST statements output.
1578      **
1579      ** What registers/RAM may be used if handled?:
1580      **   Must not alter D1 or any status bits or any R registers
1581      **   Function scratch is available
1582      **
1583      ** What registers/RAM may be used if not handled?:
1584      **   A-D, D0, D1, P
1585      **
1586      ** What registers/RAM may be used if error exit (POLL only)?:
1587      **   Not applicable
1588      **
1589      ** Special memory/pointer considerations (are pointers funny?):
1590      **   Normal memory configuration
1591      **
1592      ** Envisioned application(s):
1593      **   Extend PRINT/PLIST commands to handle unknown
1594      **   destination devices (specifically HPIL devices)
1595      **
1596      ** History:
1597      **

1608      ** Name:(S) pPRTCL - PRINT class statement handler poll
1609      **
1610      ** Category:  POLL
1611      **
1612      ** Type:      POLL
1613      **
1614      ** Purpose:
1615      **   Set up a handler for a statement type not recognized
1616      **   by the mainframe.

```

```
1617      **
1618      ** Should poll be "Handled" (return with XM=0)?:
1619      **      Yes
1620      **
1621      ** Meaning of "Handling" Poll (what does code do if handled?):
1622      **      The statement type has been recognized and statement
1623      **      scratch has been set up in accordance with CKINFO
1624      **      specifications for the specified type of statement.
1625      **
1626      ** Entry conditions for handler (registers, ST, RAM, etc.):
1627      **      Carry clear
1628      **      B[A] = Poll number.
1629      **      HEX mode.
1630      **      First nib of STMTRO is statement type
1631      **      P=0.
1632      **
1633      ** Normal exit conditions from handler if handled (ST, RAM,
1634      ** registers, etc.):
1635      **      Carry clear
1636      **      HEX mode.
1637      **      XM=0.
1638      **      STMTRO, STMTRI set according to CKINFO specifications
1639      **
1640      ** Normal exit conditions from handler if not handled (ST, RAM,
1641      ** registers, etc.):
1642      **      Carry clear
1643      **      HEX mode.
1644      **      XM=1.
1645      **
1646      ** Error exit conditions from handler (POLL only):
1647      **      Not applicable
1648      **
1649      ** Available subroutine levels:
1650      **      4
1651      **
1652      ** NOTE:
1653      **      Function scratch is available
1654      **      SCRATCH, SNAPBF, TRFMBF, LDCSPC
1655      **
1656      ** What registers/RAM may be used if handled?:
1657      **      Statement scratch should be set by poll handler
1658      **      A-D, DO, P
1659      **
1660      ** What registers/RAM may be used if not handled?:
1661      **      A-D, DO, D1, P
1662      **
1663      ** What registers/RAM may be used if error exit?:
1664      **      Not applicable
1665      **
1666      ** Special memory/pointer considerations (are pointers funny?):
1667      **      No special considerations
1668      **
1669      ** Envisioned application(s):
1670      **      Allows adding new keywords in the same class as DISP
1671      **      and PRINT.

15          *****
16          *****
17          **
18          ** Name:(S) pCALSV - Poll to save local environment on CALL
19          **
20          ** Category:  POLL
21          **
22          ** Type:      POLL
23          **
24          ** Purpose:
25          **      Give any LEX file a chance to save its local environment
26          **      when CALL is executed.
27          **
28          ** Should poll be "Handled" (return with XM=0)?:
29          **      Since this poll is intended to reach every LEX file, so
30          **      XM should always set to 1 on return.
31          **
32          ** Meaning of "Handling" Poll (what does code do if handled?):
33          **      A LEX file can put a block of its local environment on
34          **      top of the stack. When the ENDSUB is executed later on,
35          **      the LEX file can use this block to restore its local
36          **      environment.
37          **
38          ** Entry conditions for handler (registers, ST, RAM, etc.):
39          **      B[A] = Poll number.
40          **      HEX mode.
41          **      P=0.
42          **      AVMEME(available memory end) is pointing at current top
43          **      of stack.
44          **
45          ** Normal exit conditions from handler if handled (ST, RAM,
46          ** registers, etc.):
47          **      Carry clear (POLL only).
48          **      HEX mode.
49          **      XM=1.
50          **      Update the AVMEME to point at the top of the block which
51          **      just been put on to the top of the stack.
52          **
53          ** Normal exit conditions from handler if not handled (ST, RAM,
54          ** registers, etc.):
55          **      Carry clear (POLL only).
56          **      HEX mode.
57          **      XM=1.
58          **
59          ** Error exit conditions from handler (POLL only):
60          **      Carry set.
61          **      HEX mode.
62          **      C[3,0] = Error code
63          **
64          ** Available subroutine levels:
65          **      5
66          **
67          ** NOTE:
68          **      Definition of the save block: (starting from lower addr.)

```

```

69      **
70      **      Nibs      Meaning
71      **      -----
72      **      1-2      LEX file ID
73      **      3-5      Block length in nibs(not include the 1st 5 nibs)
74      **      6        ■ of update addresses following
75      **      7-n      Update addresses 5 nibs each
76      **      n-n      Anything else
77      **
78      ** What registers/RAM may be used if handled?:
79      **      A-D, DO, D1, P ,R0-R3, ST, scratch RAM
80      **
81      ** What registers/RAM may be used if not handled?:
82      **      A-D, DO, D1, P ,R0-R3, ST, scratch RAM
83      **
84      ** What registers/RAM may be used if error exit (POLL only)?:
85      **      A-D, DO, D1, P ,R0-R3, ST, scratch RAM
86      **
87      ** Special memory/pointer considerations (are pointers funny?):
88      **      None.
89      **
90      ** Envisioned application(s):
91      **      Allows a LEX file to stack and unstack local data that
92      **      is not stored in a system buffer. This may be useful
93      **      to applications which can be called recursively, since
94      **      system buffers are global and are not allocated recur-
95      **      sively.
96      **

122     **
123     ** Meaning of "Handling" Poll (what does code do if handled?):

```

```

124      **      A LEX file can restore its local environment saved at
125      **      CALL time (by respond to pCALSV poll)
126      **
127      ** Entry conditions for handler (registers, ST, RAM, etc.):
128      **      B[A] = Poll number.
129      **      HEX mode.
130      **      P=0.
131      **      CALSTK is pointing at the first of all the save blpcks.
132      **
133      ** Normal exit conditions from handler if handled (ST, RAM,
134      ** registers, etc.):
135      **      Carry clear (POLL only).
136      **      HEX mode.
137      **      XM=1.
138      **
139      ** Normal exit conditions from handler if not handled (ST, RAM,
140      ** registers, etc.):
141      **      Carry clear (POLL only).
142      **      HEX mode.
143      **      XM=1.
144      **
145      ** Error exit conditions from handler (POLL only):
146      **      Carry set.
147      **      HEX mode.
148      **      C[3,0] = Error code
149      **
150      ** Available subroutine levels:
151      **      3
152      **
153      ** NOTE:
154      **      How to find the save block of your own :
155      **
156      **      Starting from the CALSTK, look for first 2 nibbles of
157      **      each block for your LEX ID. All the save blocks are
158      **      link listed. When your block is found, just use the
159      **      information to restore your local environment, don't
160      **      collapse the block. All the update addresses in the
161      **      block are justified if memory had been moved.
162      **
163      ** What registers/RAM may be used if handled?:

325          **
326          ** Uses: Everything
327          **
328          ** Stk lvls: All
329          **
330          ** Detail:
331          **
332          ** 1. Search the subprogram and save the name on stack.
333          ** 2. Start process the actual parameters:
334          **   a. Go down the parameters list, call expression to get
335          **      every parameters.
336          **   b. Save the value or the address of each parameter on the
337          **      stack. Put a cap on top of each parameter to indicate
338          **      it is a value or an address. (Parse routine already
339          **      figured out each parameter is passed by value or by
340          **      reference).
341          **   c. If find an "@" sign preceding an expression, it must be
342          **      a channel number. Then make sure the channel is open,
343          **      also put a cap to indicate this is a channel number.
344          **   d. Call the routine DEST right after returning from the
345          **      expression execution routine. If the parameter is a non-

```

```

346      **      existent variable, call the routine NEWVAR to create the
347      **      variable. THEN collapse the stack(except the subprogram
348      **      name), process the actual parameters all over again
349      **      starting from the beginning. The reason for starting from
350      **      the beginning is that some of the references that already
351      **      been processed may need to be adjusted due to the
352      **      creation of new variable. In order to save code, I choose
353      **      to re-evaluate the all the expression rather than only to
354      **      adjust those references.
355      **
356      **      3. Save the calling environment on the stack(on top of the
357      **      actual parameters information).
358      **      (lowest address):
359      **
360      **      0004F (5 nibs): ID & length
361      **      A      (1)      : Update pointers count
362      **                      : Following 10 pointers are absolute
363      **      CURRST (5)      addresses, they will be adjusted
364      **      PRGMST (5)      when memory moved.
365      **      PRGMEN (5)
366      **      CURREN (5)
367      **      PCADDR (5)
368      **      CNTADR (5)
369      **      ERRSUB (5)
370      **      ERRADR (5)
371      **      ONINTR (5)
372      **      DATPTR (5)
373      **
374      **      Offset to previous FORSTK (5)
375      **      //      GSBSTK (5)
376      **      //      ACTIVE (5)
377      **      //      CALSTK (5)
378      **
379      **
380      **      4. A LEX file can save its local environment on the call
381      **      stack too. At this point, a poll(pCALSV) will be issued.
382      **      An LEX file when answering to this poll can put a save
383      **      block on top of the current stack pointer(pointed by D1).
384      **      The format of the save block is as follow :
385      **
386      **      nibs      meaning
387      **      ----      -----
388      **      1-2      LEX file ID.
389      **      3-5      Save block length(exclude the first 5 nibs).
390      **      6        Number of addresses follow that need to be
391      **                adjusted when memory moved.
392      **      7-11     First address if any.
393      **      .....
394      **      .....   to end of the block.
395      **
396      **      5. Search for the subprogram.
397      **
398      **      6. Set CALSTK, ACTIVE, GSBSTK, FORSTK to the current stack
399      **      pointer(MTHSTK)
400      **

```

```

401      ** 7. Clear the variable chain head table
402      **
403      ** 8. Put a level mark in the channel number assign buffer.
404      **
405      ** 9. Process the formal parameters:
406      **   a. If the parameter is a channel, open the channel.
407      **   b. Call expression execution to get each variable and
408      **      call the routine DEST right after that. Then call
409      **      the routine CR-VAR to create the dope vector of each
410      **      variable.
411      **   c. Dig out the actual parameter from the stack one at a
412      **      time and compare its type with the corresponding
413      **      formal parameter.
414      **   d. Assign value or indirect address to the formal
415      **      parameter.
416      **
417      ** 10. Pull all the actual parameter information from stack and
418      **      adjust all the offset values in the call save block.
419      **
420      ** 11. Clear ERRSUB, ERRADR, ONINTR, DATPTR
421      **
422      ** 12. Execute the subprogram.
423      **

431      **
432      ** Name:(S) CALBIN - Binary program call BASIC subprogram
433      **
434      ** Category:  STExec
435      **
436      ** Purpose:  To allow a binary program to call a BASIC
437      **             subprogram.
438      **
439      ** Entry:    This GOSBVL has to precede right before the CALL
440      **            statement. The binary file has to construct the CALL
441      **            statement exactly as it is in a BASIC file. The first
442      **            two nibs are the statement length and the last two
443      **            nibs are the EOL.
444      **
445      ** Exit:     The execution of the binary program will be resumed
446      **            after CALL statement.
447      **
448      ** Uses:     Everything
449      **
450      ** Stk lvls: Only one RSTK will be saved, the one calls CALBIN.
451      **
452      ** Note:     When CALBIN is called, the PCADDR will be set to @ the
453      **            line length of the CALL statement.
454      **            When ENDSUB is executed, if it is returning to binary
455      **            code, the PCADDR will be set to @ the end of the

1386      * NXTPRM - ROUTINE TO GET NEXT ITEM OF ACTUAL PARAMETER SAVED ON
1387      * STACK.
1388      * WHEN WE PROCESS THE ACTUAL PARAMETERS OF THE CALL STATEMENT,
1389      * THEY ARE PROCESS ONE AT A TIME FROM LEFT TO RIGHT. USUALLY,
1390      * WE WRITE 16+1 NIBBLES ON THE STACK FOR THE TYPE AND ADDRESS
1391      * OF EVERY PARAMETER. COMPLEX NUMBER USE 1+34 NIBBLES, STRING
1392      * USE 1+16+STRING LENGTH. SO WHEN WE SCAN THROUGH THE PARAMETER
1393      * LIST, THE LAST PARAMETER IS ON TOP OF THE STACK.
1394      * SO WHEN WE PASS THE ADDRESS OR VALUE TO THE PARAMETER IN THE
1395      * SUB-PROG STATEMENT, WE SHOULD GET THE NEXT ACTUAL PARAMETER
1396      * FROM THE BOTTOM OF THE STACK.
1397      * THE LOGIC WE USE TO GET THE NEXT ITEM FROM BOTTOM IS THIS:
1398      * THE NEXT ITEM IS THE N.TH ITEM FROM THE TOP POINTED BY THE
1399      * PARAMETER COUNT(PRCMNT).
1400
1401      * INPUT: (PRCMNT) = ■ OF REMAINING UNPROCESSED PARAMETERS
1402      *          (STMTDO) = ADDRESS OF THE TOP OF THE PARAMETERS
1403      *                   BLOCK ON THE STACK (LOWER END ADDRESS)
1404      * USED: D1, P, C(A), A, D(B)

1865      **
1866      ** Detail:
1867      **
1868      ** 1. The formal parameters of a function are local variables to
1869      ** the function.
1870      **
1871      ** 2. The local variables of a function are stored on the math
1872      ** stack on top of the current math stack.
1873      **
1874      ** 3. PRMPTR are a seven nibbles vector which point to the
1875      ** function parameter stack. The first two nibbles is the
1876      ** parameter count. The count is equal to the number of
1877      ** parameters minus one.
1878      **
1879      **      Parameter count = 0 - Not executing an UDF.
1880      **      //              = 1 - The UDF has no parameter.
1881      **      //              = n - Number of parameters equal to n-1.
1882      **
1883      ** 4. If parameter count is non-zero, the next five nibbles is
1884      ** the address of the first parameter. All the dope vectors
1885      ** of the parameter are next to each other just like a block
1886      ** of variables that have the same letter.
1887      **

```

```

1888      ** 5. The dope vector of the function value is placed after the
1889      **      parameters just above the old math stack.
1890      **
1891      ** 6. Above the parameter stack, there is a block of memory used
1892      **      as a function stack.
1893      **      The items stacked by an user defined function are:
1894      **
1895      **      a. F00000 (6) - This five zeros prevent the function stack
1896      **                      been taking the GOSUB return address.
1897      **
1898      **      b. program pointer (5) Following 7 pointers are absolute
1899      **      c. PCADDR          (5) addresses, they will be justified
1900      **      CNTADR            (5) when program memory moved.
1901      **      d. STMTD0          (5)
1902      **
1903      **      e. 3 addresses popped off from the hardware stack (15)
1904      **
1905      **      f. STMTD1 (5) This five nibbles are assumed to be stack
1906      **                      pointer. If the user function creates a new
1907      **                      variable, this address will be justified.
1908      **
1909      **      g. STMTRO (16) Following 32 nibbles are statement scratch
1910      **      h. STMTRI (16) register 0 & 1. STMTRO[4:0] is assumed to be
1911      **                      destination of the assignment statement. It
1912      **                      will be justified if math stack moved.
1913      **                      STMTRI[14:10] is assumed to be the PC points
1914      **                      at the destination variable. It will be
1915      **                      justified if program memory moved.
1916      **
1917      **      i. Offset to previous MTHSTK (5)

226 **
227 ** Name:(S) RENSUB - Renumber Subroutine
228 **
229 ** Category:  FILUTL
230 **
231 ** Purpose : 1. Compile all line number references
232 **           2. Clear all compiled offsets
233 **           3. Renumber all line number references
234 **
235 ** Entry : CURRST & CURREN pts current file
236 **         S1 = 0 - Only clear compiled offset
237 **         = 1 - Compile offset or renumber line number
238 **         If S1=1 :
239 **             S2 = 1 - Compile reference offset
240 **             S2 = 0 - Renumber line number
241 **
242 ** Exit : Carry set => No error
243 **         Carry clear=> Line number not found
244 **         R2= ptr to stmt len of stmt in error
245 **
246 ** Calls : PFNDL*, EXPSKP, FINDA, ISRAM?, LINE#1, POLL
247 **
248 ** Uses : A,B(A),C,D(A),DO,D1,R2, S3
249 **
250 ** Stk lvls : +2
251 **
252 ** Detail :
253 **
254 ** The line number is expected to be found in the following
255 ** mainframe statements:
256 **
257 ** 1. GOTO/GOSUB/RESTORE <LINE#/LABEL>
258 ** 2. ON ERROR GOTO/GOSUB <LINE#/LABEL>
259 ** 3. ON TIMER [N<exp>,<exp>] GOTO/GOSUB <LINE#/LABEL>
260 ** 4. ON <exp> GOTO/GOSUB/RESTORE <LINE#/LABEL>,...
261 ** 5. IF <exp> THEN LINE#/LABEL/EXT [ELSE LINE#/LABEL/EXT IF]
262 ** 6. PRINT USING LINE#/LABEL
263 ** 7. DISP USING LINE#/LABEL
264 ** 8. ON INTR GOTO/GOSUB LINE#/LABEL
265 ** 9. POLL for non-mainframe XWORD
266 **
267 ** For XWORD (External) statements, the line number is handled
268 ** as follows:
269 **
270 ** . If RENSUB is just called for zeroing the compiled offset
271 **   (S1=0), the line # in XWORD statement will be ignored. This
272 **   means the execution of an XWORD statement has to assume the
273 **   compiled offset is incorrect and has to zero it everytime.
274 ** . If RENSUB is called for renumbering (S1=1), the poll pREN
275 **   will be issued so that each LEX file that contains XWORD

```

```

276      ** statements that may have line numbers will be allowed to
277      ** supply the correct renumbering. See the pREN poll inter-
278      ** face for details.
279      **

282      **
283      ****
284      ****
285      **
286      ** Name:(S) pREN - Renumber an XWORD line# reference
287      **
288      ** Category: POLL
289      **
290      ** Type: POLL
291      **
292      ** Purpose:
293      ** Renumber a XWORD statement if it has line number as its
294      ** arguments.
295      **
296      ** Should poll be "Handled" (return with XM=0)? :Yes
297      **
298      ** Meaning of "Handling" Poll (what does code do if handled?):
299      ** Return D1 points to where the line number is.
300      **
301      ** Entry conditions for handler (registers, ST, RAM, etc.):
302      ** B[A] = Poll number.
303      ** HEX mode.
304      ** P=0.
305      ** A[4-0] = LEX file ID and fcn #
306      ** D1 past the XWORD tokens.
307      **
308      ** Normal exit conditions from handler if handled (ST, RAM,
309      ** registers, etc.):
310      ** Carry clear (POLL only).
311      ** HEX mode.
312      ** XM=0.
313      ** D1 @ the line number token(tLINE# or tLITRL)
314      ** S3 = 1, if there are more than one line numbers followed.
315      **
316      ** Normal exit conditions from handler if not handled (ST, RAM,
317      ** registers, etc.):
318      ** Carry clear.
319      ** HEX mode.
320      ** XM=1.
321      **
322      ** Error exit conditions from handler (POLL only):
323      ** Carry set.
324      ** HEX mode.
325      ** Will exit to MEMERR(Insufficient Memory).
326      **
327      ** Available subroutine levels: 5
328      **
329      ** What registers/RAM may be used if handled?:
330      ** A-D, D0, P

```

```
331      **
332      ** What registers/RAM may be used if not handled?:
333      **      A-D, DO, P
334      **
335      ** What registers/RAM may be used if error exit (POLL only)?:
336      **      A-D, DO, P
337      **

30          ** Name:(S) VAL00 - Parse and Execute a String on Stack
31          **
32          ** Category: EXCUTL
33          **
34          ** Purpose:
35          ** System VAL function. Converts a string into a number.
36          ** Any valid numeric expression may be passed.
37          **
38          ** Entry:
39          ** P = 0
40          ** D1 points to string on top of math stack.
41          ** ST10 (=ValSub) set iff VAL is being called
42          ** as a subroutine.
43          ** Will cause "Data Type" error instead of
44          ** "Invalid Argument" and will require the
45          ** valid expression to be followed by a CR.
46          **
47          ** Exit:
48          ** P = 0
49          ** String on top of stack has been replaced by the value
50          ** obtained by parsing and executing the string.
51          **
52          **

```

```

53      ** Calls:      XXHEAD,STKCHR,ADHEAD,REVPOP,EXCPAR,OUTBYT,
54      **              MOVED2,PSHSTK,EXPR,POPSTK,POP1N,AVE=D1,MFERR
55      **
56      ** Uses.....
57      ** Inclusive: A,B,C,D,R0,R1,R2,R3,R4,D1
58      **
59      ** Stk lvls:   4
60      **
61      ** NOTE:
62      **      This routine calls expression execute which may call a
63      **      user defined function; this may alter a lot of RAM
64      **      locations. The DO that is passed in is kept on the
65      **      GOSUB stack so it will be updated if memory moves.
66      **
67      ** Algorithm:
68      **      Appends a CR to string on stack.
69      **      Reverses string.
70      **      Parses string and verifies it is a valid numeric expr.
71      **      Appends an EOL to parsed code.
72      **      Moves parsed code onto stack, covering original string.
73      **      Saves 2 RSTK levels and DO (PC) on GOSUB stack.
74      **      Calls EXPR to evaluate expression.
75      **      Pops value from stack.
76      **      Collapses parsed code from stack.
77      **      Checks validity of pointers saved on GOSUB stack
78      **      and jumps to MFERR(EMMCOR) if any are not valid.
79      **      Restores 2 RSTK levels and DO (PC) from GOSUB stack.
80      **      Pushes value on stack.
81      **      Returns
82      **
83      ** History:
84      **

9      TITLE  External GOSUB Module<831216.1453>
10 1AF01      ABS      #1AF01
11      RDSYMB SBZRAM::MS
12      ****
13      ****
14      **
15      ** Name:(S) MGOSUB - Execute A GOSUB From Movable Code
16      **
17      ** Category:  EXCUTL
18      **
19      ** Purpose:
20      **      Allows code which may move (such as code within a
21      **      LEXfile in RAM) to GOSUB to a utility which may
22      **      move it (such as a file expand utility). The utility
23      **      will return to the LEXfile properly even if it moved.
24      **
25      ** Entry:
26      **      Instead of GOSBVL <address of desired routine>, call
27      **      the routine as follows:
28      **
29      **      GOSBVL =MGOSUB
30      **      CON(5) <address of desired subroutine>
31      **      .
32      **      .
33      **      .
34      **
35      **      All registers and modes should be set up as required by
36      **      the subroutine.
37      **
38      ** Exit:
39      **      Execution resumes at the location following the CON(5)
40      **      at the call to MGOSUB.
41      **      All registers, modes and carry are returned by
42      **      the subroutine.
43      **
44      ** Calls:      STRALL, PSHMCR, POPGSB, RCLALL (falls through)
45      **
46      ** Uses.....
47      **      RAM: SCRTCH, SCREX0, SCREX1, SCREX2
48      **      Register usage is dictated completely by the
49      **      requested subroutine.
50      **
51      ** Stk lvls:  MAX ( 3, <#levels used by requested subroutine>)
52      **
53      ** NOTE:
54      **      The scratch RAM is used before and after this code
55      **      calls the requested subroutine, but not during.

```

```

56      **      Thus the subroutine can use the scratch RAM locally,
57      **      but not to pass information back to the calling
58      **      routine. The calling routine obviously cannot keep
59      **      anything there which is expected to survive =MGOSUB.
60      **
61      **      =MGOSUB acts transparently for everything, including
62      **      CARRY and SB.
63      **
64      **      Because the return address is kept in RAM, the called
65      **      subroutine will see the return address of MGOSUB, not
66      **      of the calling code. So MGOSUB cannot be used to call
67      **      a subroutine which uses the return address as a pointer
68      **      to data (such as FINDA, TBLJMP, CALBIN and FPOLL).
69      **      Neither POLL nor FPOLL can be called through MGOSUB.
70      **
71      **      Callers to POLL can breathe easily despite this caveat.
72      **      POLL also updates the calling address, and so can be
73      **      called directly from movable code. This is not the
74      **      case for FPOLL.
75      **

```

Detail:

Calling sequence:

```

GOSBVL =MGOSUB
CON(5) <address of desired subroutine>
<execution resumes here after return>

```

Algorithm:

```

Stores the return address (address past the CON(5)) on
Gosub stack.
Executes subroutine; address on Gosub stack will be
adjusted as necessary if subroutine does a RFADJ.
Retrieves return address from Gosub stack.
Returns to code which called us.

```

History:

13 **
14 ** Name:(S) RND-12 - Round A 12-digit Fp Number
15 **
16 ** Category: MTHUTL
17 **
18 ** Purpose:
19 ** Round of a floating-point number at specified digit.
20 **
21 ** Entry:
22 ** A = number (12-digit floating-point).
23 ** P points to digit where rounding is to take place. See
24 ** detail, below.
25 **
26 ** Exit:
27 ** P=0.
28 ** A=Rounded (not IEEE-rounded) 12-digit form.
29 ** If P=15 on entry, no rounding was done.
30 ** Carry set iff rounding overflowed (returns MAXREAL).
31 **
32 ** Calls: None.
33 **
34 ** Uses.....
35 ** A,B,P.
36 **
37 ** Stk lvls: 0
38 **
39 ** Detail:
40 ** Typically called after IF12A, which sets P to point at
41 ** the first fractional digit.
42 **
43 ** History:
44 **
45 ** Date Programmer Modification
46 ** -----
47 ** 10/17/83 SA Wrote

178 ** Name:(S) HASH1 - Indexed Jump Through A GOTO Table
179 ** Name:(S) HASH2 - Indexed Jump Through A GOTO Table
180 **
181 ** Category: EXCUTL
182 **
183 ** Purpose:
184 ** Jump into a table of GOTOs (or other 4-nibble beasts)
185 ** according to an index variable.
186 **
187 ** Entry:
188 ** A[A] = Hash byte (maximum 3FF).
189 ** HASH1: RSTK = Address of start of GOTO table.
190 ** HASH2: C[A] = Address of start of GOTO table.
191 **
192 ** Exit:
193 ** This routine exits by jumping to the A[A]'th entry
194 ** in the GOTO table.
195 **
196 ** Calls: None.
197 **
198 ** Uses.....
199 ** A[X], C[A].
200 **
201 ** Stk lvls: HASH1: 0.
202 ** HASH2: 1.
203 **
204 ** Detail:
205 ** Typical use:
206 ** GOSBVL =HASH1
207 ** GOTO L0
208 ** GOTO L1
209 ** GOTO L2
210 ** GOTO L3
211 ** GOTO L4
212 ** GOTO L5
213 ** GOTO L6
214 **
215 **
216 ** The GOSBVL puts the address of the GOTO table on RSTK;
217 ** HASH1 peels it off. Note that this GOSBVL is actually
218 ** acting like a GOTO; control will never return to the
219 ** code in the vicinity of the GOSBVL.

■ The above token values fall in the following ranges.
★ Values in parentheses are presently not used, and are reserved for future use:
■ Tokens not identifying the end of a field, not used in backward search:
 (any value < D0) D0 D1 D2 D3 D4 (D5) (D6) (D7)
■ Tokens not identifying the end of a field, and used in backward search:
 D8 D9 DA DB DC (DD) DE DF E0 (E1) (E2) (E3) (E4) (E5)
★
■ Tokens identifying the end of a field (including those that start a new one), not used in backward search:
 (E6) (E7) (E8) (E9) (EA) (EB) (EC) (ED) EE EF FO
★
■ Tokens identifying the end of a field (including those that start a new one), used in backward search:
 F1 (F2) (F3) F4 (F5) F6 F7 F8 F9 FA FB FC FD (FE) (FF)
■
■ In truth, future applications may use ANY token values (or ASCII bytes, including any value above D0 if desired) for execution, providing that these token values:
★ 1) are "protected" from the execution and backward search routines by appropriate tokens (such as uIMXCH and uJMPst, respectively). For instance, using the token value 44 (ASCII "D") for anything other than to output a digit will require a uIMXCH token to handle it. Or including a 5-nibble pointer (which might contain, say, an F7 byte, by chance) requires a uIMXCH token to execute around it, and a uJMPst token to jump backwards over it.
★
or,
2) cannot look like a token which will be executed or affect the backward search. For instance, the MATH ROM places the two bytes uIMXCH and an ASCII ")" in the token stream; since an ASCII ")" won't cause any problems during execution or back-up, they are not protected.
■
■ Specifically, any token which may be found by the backward search routine is subject to the following rule:
★ 1) A value >= F1 identifies a delimiter in the IMinIt routine. IMinIt will replace this token with the new one which identifies the type of field.
■
■ Any token which may be found by the execution routine is subject to the following two rules:
★ 1) A value >= F6 identifies the start of an output field. EXPEXC will be called to evaluate the next output item, and formatting will be attempted.
★ 2) During the float-check and skip-checks (**), any token value >= E6 identifies the end of the check.

```
144      ■      Symbols beyond this will not be counted; if you
145      ■      want the count to continue beyond such ■ token,
146      ■      you must protect it with a uMULT token, a uSTRPT
147      ■      token, or a combination of uIMXCH with either.
148      ■
149      ■      (**) The float-check is performed on numeric "D"
150      ■      fields to count the number of positions to float
151      ■      editing symbols and signs. The skip-check is
152      ■      performed on any numeric field to count the number
153      ■      of spaces before displaying NaN or Inf, or to count
154      ■      the number of positions to fill with *'s in the
155      ■      case of an IMAGE Ovfl warning.
156      ■
157      ■      See the pIMXCH poll documentation for examples of
158      ■      protecting tokens from execution and backward searches.

212          **
213          ** IMAGE strings are not parsed until the string is accessed
214          ** for DISP USING execution (or PRINT USING, ENTER USING,
215          ** etc.).
216          **
217          ** Parsing of an IMAGE string is no simple task; the syntax is
218          ** very flexible, while there are more than two dozen
219          ** stringent rules.
220          **
221          ** There are two types of IMAGE strings. For example,
222          **
223          **      1) DISP USING 100; M
224          **          where line 100 contains an IMAGE statement
225          **          with image string
226          **      2) DISP USING <string expression>; M
227          **          where <string expression> is a combination of
228          **          string constants or variables, such as
229          **          "3X,4Z,A" , or Y$(2) , or S$8"5X,"&FNI$
230          **
231          ** When a DISP USING statement is executed, the image string
232          ** is copied to the end of available memory, verbatim. In
233          ** case 1), above, the image routines perform the copy; in
234          ** case 2), the routine EXPEXC (expression execute) evaluates
235          ** the expression and puts it at the end of available memory.
236          ** In either case, a uMend byte is placed immediately
237          ** following the copy of the image string, so that the parse
238          ** routines can identify the end of the string. Then this
239          ** copy is used to build a stream of tokens for execution of
240          ** the DISP USING statement.
241          **
242          ** A tokenized image string can only reside in RAM, since loop
243          ** counters (symbols with multipliers generate loop counters)
244          ** are stored as part of the tokenized stream. (An
245          ** application could conceivably store tokenized image streams
246          ** in ROM if no multipliers were used. It would of course
247          ** need a special symbol to reference the fixed tokens, and
248          ** poll handlers to position the image execution routines into
249          ** the token stream.)
250          **
251          ** In the discussion which follows, AvMemSt refers to
252          ** "Available Memory Start", the memory location whose address
253          ** is stored in RVMEMS. Similarly, AvMemEnd refers to
254          ** "Available Memory End", the memory location whose address
255          ** is stored in RVMESE. This discussion also refers
256          ** frequently to the IMAGE tokens which are equated at the
257          ** beginning of this module; see the list of equates for the
258          ** names and meanings of the tokens.

uIMend token

The basic scheme behind image parsing can be described in this algorithm:

- 1) parse the image string until a field is encountered which requires an output item, or until end of image string.
- 2) stop parsing, execute all pending fields
- 3) if end of string, goto (4), else goto 1).
- 4) if more items in output list, reposition execution pointer to start of token stream and restart execution until output list exhausted.

It can be seen, then, that the IMAGE routines alternate between parsing and executing. There are several reasons for this design; two important ones are 1) it does not require the entire image string to be parsed if the output list is short, and 2) it allows polls to be issued between fields so that "external" execution can be performed on the tokens (such as `ENTER USING`).

The token stream is organized according to the image fields. Every time a new field is encountered, a delimiting token is placed in the stream, and two 4-nibble counters are initiated in the token stream to keep track of the number of digits before and after a decimal point (if it turns out to be a numeric field). Then ASCII bytes are placed in the token stream to direct the execution routines to the type of output to generate. Periodically, the token stream has to be scanned backwards to change a field delimiter (such as when `E` is encountered), or update the digit counters (for instance, when the field ends).

The best way to describe the process is with an example. Assume we are executing an IMAGE string as follows:

```
#4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
```

We will build the token stream here, byte by byte. As the parsing progresses, the current character in the image string will be indicated with a "^", as follows:

```
#4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
```

(i.e., `^` are about to parse the first character)

To keep the description byte-oriented, the image symbols

```

320      ** will be abbreviated as shown:
321      ** uA = uALit "A" literal field
322      ** uB = uLOOPB Loop nn byte
323      ** uC = uCPLXC Complex field closed
324      ** uD = uDELIM Delimiter
325      ** uE = uNUMEn Numeric, w/Exponent, no sign
326      ** uF = uNUMFn Numeric, w/float chars, no sign
327      ** uG = uNUMFs Numeric, w/float chars, w/sign
328      ** uH = uHKB^ H,K,B or ^ field
329      ** uI = uIMsta IMAGE string start
330      ** uJ = uJMPst Jump over string pointer (14 nibs)
331      ** uK = uIMbck Poll for backward search handler
332      ** uL = uLOOPS Loop nn string (12 nibs)
333      ** uM = uMULT Multiplier
334      ** uN = uNUMNn Numeric, no float chars, no sign
335      ** uO = uOPNUM Open loop with multiplier
336      ** uP = uLOOPP Loop on parentheses (variable #bytes)
337      ** uQ = uOPNM- Open loop with mult, decremented
338      ** uR = uRESTP Restart parse
339      ** uS = uSTRPT String pointer
340      ** uT = uNUMEs Numeric, w/Exponent, w/sign
341      ** uU = uNUMNs Numeric, no float chars, w/sign
342      ** uW = uOPNNM Open loop without multiplier
343      ** uX = uIMXCH Strange execution character
344      ** u8 = uJMPd1 Jump over unfilled delimiter (8 nibs)
345      ** u9 = uJMP{} Jump over paren loop ptr (9 nibs)
346      ** u$ = uIMend IMAGE string end
347      **
348      ** and the symbols
349      ** =# =D =. =X =A =M =Z =E =S =K and =)
350      ** will refer to the ASCII byte values for the characters.
351      **
352      ** The example includes a complex field, which is handled by a
353      ** poll in the MATH ROM; this is shown to describe one
354      ** implementation of image token handling.
355      **
356      ** Here goes....
357      **
358      ** The image string has been copied into AvMem, verbatim, and
359      ** a uIMend token immediately follows it. The parse pointer
360      ** points to the first character; tokens will be built below
361      ** this area. A uIMsta (image start) token is immediately
362      ** written as the first token, and the execution anchor (the
363      ** location where execution will start) is set to this token:
364      **
365      **                                     uI
366      **                                     (1)
367      **
368      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
369      **      ^
370      **
371      **                                     =# uI
372      **                                     (2)(1)
373      **
374      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)

```

```

375      **      ^
376      **
377      **              40 00 u0 00 uM =# uI
378      **              (7--6)(5--4)(3)(2)(1)
379      **
380      **  As in any multiplied field, (4) and (5) will become the
381      **  reference counter, and (6) and (7) will become the loop
382      **  counter. NOTE: the bytes (6) and (7) show the multiplier
383      **  value "0004", written backwards as it would show up in
384      **  memory. This convention is followed throughout the
385      **  example.
386      **
387      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
388      **      ^
389      **
390      **              u8 00 00 00 uD 40 00 u0 00 uM =# uI
391      **              (12)(11)(10)(9)(8)(7--6)(5--4)(3)(2)(1)
392      **
393      **  The "(" symbol defines the first field. Any time a new
394      **  field is found, tokens (8) through (12) are written out.
395      **
396      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
397      **      ^
398      **
399      **              30 00 u0 00 uM u8 00 00 00 uD 40 00 u0 00 uM
400      **              (17--16)(15--14)(13)(12)(11)(10)(9)(8)(7--6)(5--4)(3)
401      **
402      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
403      **      ^
404      **
405      **  This is the first output symbol in the output field, so we
406      **  now can identify the first field with a uNUMFn (numeric,
407      **  with floating symbols, no sign). A backward search finds
408      **  the delimiter token at (8); however, there are pending
409      **  fields to be executed (for the first field, this may not
410      **  really be true, but execution starts anyway). Therefore
411      **  token (8) is replaced with a uRESTP and execution starts.
412      **              V
413      **              30 00 u0 00 uM u8 00 00 00 uR 40 00 u0 00 uM
414      **              (17--16)(15--14)(13)(12)(11)(10)(9)(8)(7--6)(5--4)(3)
415      **
416      **  The execution routine writes several storage fields below
417      **  token (17), adjusts AvMemEnd to protect them, sends out a
418      **  pIMXQT poll, and then executes the pending tokens. Token
419      **  (3) causes the loop counter in (7--6) to be decremented,
420      **  and replaces (5) with a uOPNM- token to indicate that the
421      **  loop counter has been decremented:
422      **              V      V
423      **              30 00 u0 00 uM u8 00 00 00 uR 30 00 uQ 00 uM
424      **              (17--16)(15--14)(13)(12)(11)(10)(9)(8)(7--6)(5--4)(3)
425      **
426      **  In all, tokens (1) through (8) are executed; token (8)
427      **  causes the parse routines to be invoked again, starting at
428      **  the last token which was parsed, the "D". The execution
429      **  anchor is set at token (8), the location where execution

```

```

430      ** will start again.
431      **
432      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
433      **      ^
434      **
435      ** Again, this is the first output character in an output
436      ** field, so we back up through the tokens and re-write (8)
437      ** with:
438      **
439      **      30 00 uD 00 uM u8 00 00 00 uF 30 00 uQ 00 uM
440      **      (17--16)(15--14)(13)(12)(11)(10)(9)(8)(7--6)(5--4)(3)
441      **
442      ** Simultaneously, the multiplier at (13) is identified to be
443      ** associated with the "D", so the reference counter is filled
444      ** in, and the "D" is written out with a token to define the
445      ** loop:
446      **
447      **      uB =D 30 00 30 00 uM u8 00 00 00 uF 30 00 uQ
448      **      (19)(18)(17--16)(15--14)(13)(12)(11)(10)(9)(8)(7--6)(5-
449      **
450      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
451      **      ^
452      **
453      ** A lower case symbol is always converted to uppercase:
454      **
455      **      =D uB =D 30 00 30 00 uM u8 00 00 00 uF 30
456      **      (20)(19)(18)(17--16)(15--14)(13)(12)(11)(10)(9)(8)(7--
457      **
458      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
459      **      ^
460      **
461      ** The radix symbol causes both 4-nibble counters (9) through
462      ** (12) to be filled in with the number of digits before the
463      ** radix. Also, the symbol is written out:
464      **
465      **      =. =D uB =D 30 00 30 00 uM 40 00 40 00 uF
466      **      (21)(20)(19)(18)(17--16)(15--14)(13)(12)(11)(10)(9)(8)
467      **
468      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
469      **      ^
470      **
471      ** Only a "D" is allowed after a radix (not "Z" or "*"), but
472      ** in fact, a "D" after the radix acts like a "Z". That is,
473      ** any leading zeroes in a fraction ARE displayed. So this
474      ** symbol is written out as a "Z":
475      **
476      **      =Z =. =D uB =D 30 00 30 00 uM 40 00 40 00
477      **      (22)(21)(20)(19)(18)(17--16)(15--14)(13)(12)(11)(10)(9)
478      **
479      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
480      **      ^
481      **
482      **      20 00 uD 00 uM =Z =. =D uB =D 30 00 30
483      **      (27--26)(25--24)(23)(22)(21)(20)(19)(18)(17--16)(15--
484      **

```

```

485      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
486      **
487      **
488      **      A delimiter means that the previous field is terminated;
489      **      since it is a numeric field, the total number of digits
490      **      must be entered in its field delimiter. A backward search
491      **      is initiated that finds its delimiter at (8), and the total
492      **      number of digits is filled in:
493      **
494      **              V
495      **      =. =D uB =D 30 00 30 00 uM 50 00 40 00 uF
496      **      (21)(20)(19)(18)(17--16)(15--14)(13)(12)(11)(10)(9)(8)
497      **
498      **      Then a new field is opened:
499      **
500      **      u8 00 00 00 uD 20 00 uD 00 uM =Z =. =D
501      **      (32)(31)(30)(29)(28)(27--26)(25--24)(23)(22)(21)(20)
502      **
503      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
504      **
505      **
506      **      30 00 uD 00 uM u8 00 00 00 uD 20 00 uD
507      **      (37--36)(35--34)(33)(32)(31)(30)(29)(28)(27--26)(25-
508      **
509      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
510      **
511      **
512      **      When an imbedded literal is found, we write out a uSTRPT
513      **      token and a 5-nibble offset which points to the address of
514      **      the literal in the copied image string. This 5-nibble
515      **      offset is shown as "<ofs>".
516      **
517      **      <ofs> uS 30 00 uD 00 uM u8 00 00 00 uD 20
518      **      (39)(38)(37--36)(35--34)(33)(32)(31)(30)(29)(28)(27-
519      **
520      **      Now the parse routines scan the image string until the
521      **      matching quote is found, counting the length of the
522      **      imbedded literal (in bytes). This length is stored as a
523      **      5-nibble field shown as "<len>" (in this case, the length
524      **      is 3, and would appear in RAM as "30000").
525      **
526      **      uJ<len><ofs> uS 30 00 uD 00 uM u8 00 00 00
527      **      (41)(40)(39)(38)(37--36)(35--34)(33)(32)(31)(30)(29)
528      **
529      **      Simultaneously, the multiplier at (33) is identified to be
530      **      associated with the imbedded literal. A uLOOPS token is
531      **      written out to define the loop, and the reference counter
532      **      is filled in.
533      **
534      **              V
535      **      uL uJ<len><ofs> uS 30 00 30 00 uM u8 00 00 00
536      **      (42)(41)(40)(39)(38)(37--36)(35--34)(33)(32)(31)(30)(29)
537      **
538      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
539      **
540      **      The comma is a new delimiter:

```

```

540      **
541      **      u8 00 00 00 uD uL uJ<len><ofs> uS 30 00 30 00
542      **      (47)(46)(45)(44)(43)(42)(41)(40)(39)(38)(37--36)(35--34)
543      **
544      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
545      **
546      **
547      **      The left parenthesis is also a new delimiter. But a check
548      **      is made to see if a delimiter has just been opened, in
549      **      order to save RAM. Since this is the case, the BldIMG
550      **      pointer is backed up 5 bytes, to (42), so that the new
551      **      field will overwrite the one already opened.
552      **
553      **      uL uJ<len><ofs> uS 30 00 30 00
554      **      (42)(41)(40)(39)(38)(37--36)(35--34)
555      **
556      **      Before opening a new field, a left parenthesis without a
557      **      multiplier has to be identified so that the closing
558      **      parenthesis can be matched later:
559      **
560      **      u8 00 00 00 uD uW uL uJ<len><ofs> uS 30 00 30
561      **      (48)(47)(46)(45)(44)(43)(42)(41)(40)(39)(38)(37--36)(35-
562      **
563      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
564      **
565      **
566      **      The entire multiplier is scanned, to fill in the multiplier
567      **      counter (remember the convention of writing multipliers
568      **      backwards):
569      **
570      **      32 70 uD 00 uM u8 00 00 00 uD uW uL uJ<len>
571      **      (53--52)(51--50)(49)(48)(47)(46)(45)(44)(43)(42)(41)(40)
572      **
573      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
574      **
575      **
576      **      The "X" also closes the multiplier at (49).
577      **      V V
578      **      uB =X 32 70 32 70 uM u8 00 00 00 uD uW uL
579      **      (55)(54)(53--52)(51--50)(49)(48)(47)(46)(45)(44)(43)(42)
580      **
581      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
582      **
583      **
584      **      A closing parenthesis initiates a backward search that
585      **      scans for the nearest open left parenthesis; in this case,
586      **      it is at token (43). Since this parentheses field does not
587      **      have a multiplier, (43) is simply zeroed to "hide" it from
588      **      further backward searches. In addition, a right
589      **      parenthesis is a new delimiter.
590      **      V
591      **      uB =X 32 70 32 70 uM u8 00 00 00 uD 00 uL
592      **      (55)(54)(53--52)(51--50)(49)(48)(47)(46)(45)(44)(43)(42)
593      **
594      **      u8 00 00 00 uD uB =X 32 70 32 70 uM u8 00

```

```

595      **      (60)(59)(58)(57)(56)(55)(54)(53--52)(51--50)(49)(48)(47)
596      **
597      **      #4(3Dd.D2(3"Ha!",(723x),"$"4D6"?Ds,3A,C(2(MZ.dE)))K)
598      **
599      **
600      **      The comma is a new delimiter, but, again, it is detected
601      **      that a delimiter has just been opened; in order to save
602      **      some RAM, the BldIMG pointer is backed up to (55) so that
603      **      the 5 bytes simply overwrite the present ones:
604      **      V      V      V      V      V
605      **      u8 00 00 00 00 uD uB =X 32 70 32 70 uM u8 00
606      **      (60)(59)(58)(57)(56)(55)(54)(53--52)(51--50)(49)(48)(47)
607      **
608      **      #4(3Dd.D2(3"Ha!",(723x),"$"4D6"?Ds,3A,C(2(MZ.dE)))K)
609      **
610      **
611      **      Write out length and offset to imbedded literal "$":
612      **
613      **      uJ<len><ofs> uS u8 00 00 00 uD uB =X 32 70 32
614      **      (64)(63)(62)(61)(60)(59)(58)(57)(56)(55)(54)(53--52)(51-
615      **
616      **
617      **      #4(3Dd.D2(3"Ha!",(723x),"$"4D6"?Ds,3A,C(2(MZ.dE)))K)
618      **
619      **
620      **      40 00 uD 00 uM uJ<len><ofs> uS u8 00 00 00 uD
621      **      (69--68)(67--66)(65)(64)(63)(62)(61)(60)(59)(58)(57)(56)
622      **
623      **      #4(3Dd.D2(3"Ha!",(723x),"$"4D6"?Ds,3A,C(2(MZ.dE)))K)
624      **
625      **
626      **      Finally, we find the first output symbol for an output
627      **      field. This causes a backward search to the pending
628      **      delimiter at (56). Since there are pending output fields
629      **      which need to be executed, (56) is overwritten with a
630      **      uRESTP token, and execution begins:
631      **
632      **      40 00 uD 00 uM uJ<len><ofs> uS u8 00 00 00 uD
633      **      (69--68)(67--66)(65)(64)(63)(62)(61)(60)(59)(58)(57)(56)
634      **
635      **      The execution routine writes several storage fields below
636      **      token (69), adjusts AvMemEnd to protect them, sends out a
637      **      pIMXQT poll, and then executes the pending tokens. Tokens
638      **      (8) through (56) are executed. Token (23) causes the loop
639      **      counter in (27--26) to be decremented, and replaces (25)
640      **      with a uOPNM- token to indicate that the loop counter has
641      **      been decremented:
642      **      V      V
643      **      u8 00 00 00 uD 10 00 uQ 00 uM =Z =. =D
644      **      (32)(31)(30)(29)(28)(27--26)(25--24)(23)(22)(21)(20)
645      **
646      **      Token (56) causes the parse routines to be invoked again,
647      **      starting at the last token which was parsed, the "D". The
648      **      execution anchor is set at token (56), the location where
649      **      execution will start again.

```

```

650      **
651      **      #4(3Dd.D2(3"Ha!",(723x),"4D6"?Ds,3A,C(2(MZ.dE)))K)
652      **
653      **
654      **      Again, this is the first output symbol in an output field,
655      **      so a backward search finds (56) to define the field:
656      **
657      **      40 00 u0 00 uM uJ<len><ofs> uS u8 00 00 00 uF
658      **      (69--68)(67--66)(65)(64)(63)(62)(61)(60)(59)(58)(57)(56)
659      **
660      **      Simultaneously, the multiplier at (65) is closed, and the
661      **      parsed symbol is written out:
662      **
663      **      uB =D 40 00 40 00 uM uJ<len><ofs> uS u8 00 00
664      **      (71)(70)(69--68)(67--66)(65)(64)(63)(62)(61)(60)(59)(58)
665      **
666      **      #4(3Dd.D2(3"Ha!",(723x),"4D6"?Ds,3A,C(2(MZ.dE)))K)
667      **
668      **
669      **      60 00 u0 00 uM uB =D 40 00 40 00 uM uJ<len>
670      **      (76--75)(74--73)(72)(71)(70)(69--68)(67--66)(65)(64)(63)
671      **
672      **      #4(3Dd.D2(3"Ha!",(723x),"4D6"?Ds,3A,C(2(MZ.dE)))K)
673      **
674      **
675      **      Write out offset and length for "?" literal, close
676      **      multiplier at (72):
677      **
678      **      uL uJ<len><ofs> uS 60 00 60 00 uM uB =D 40 00
679      **      (81)(80)(79)(78)(77)(76--75)(74--73)(72)(71)(70)(69--68)
680      **
681      **      #4(3Dd.D2(3"Ha!",(723x),"4D6"?Ds,3A,C(2(MZ.dE)))K)
682      **
683      **
684      **      =D uL uJ<len><ofs> uS 60 00 60 00 uM uB =D 40
685      **      (82)(81)(80)(79)(78)(77)(76--75)(74--73)(72)(71)(70)(69--
686      **
687      **      #4(3Dd.D2(3"Ha!",(723x),"4D6"?Ds,3A,C(2(MZ.dE)))K)
688      **
689      **
690      **      The sign symbol changes the type of field to uNUMFs
691      **      (numeric with floating symbols, with sign). A backward
692      **      search changes the delimiter token at (56):
693      **
694      **      40 00 40 00 uM uJ<len><ofs> uS u8 00 00 00 uG
695      **      (69--68)(67--66)(65)(64)(63)(62)(61)(60)(59)(58)(57)(56)
696      **
697      **      And the "S" is placed in the token stream:
698      **
699      **      =S =D uL uJ<len><ofs> uS 60 00 60 00 uM uB =D
700      **      (83)(82)(81)(80)(79)(78)(77)(76--75)(74--73)(72)(71)(70)
701      **
702      **
703      **      #4(3Dd.D2(3"Ha!",(723x),"4D6"?Ds,3A,C(2(MZ.dE)))K)
704      **

```

```

705      **
706      ** This comma closes the numeric field. A backward search is
707      ** initiated to find the delimiter at (56) to fill in the
708      ** total number of digits:
709      **
710      **          V          V
711      **      40 00 40 00 uM uJ<len><ofs> uS 50 00 50 00 uG
712      **      (69--68)(67--66)(65)(64)(63)(62)(61)(60)(59)(58)(57)(56)
713      **
714      ** The delimiter also opens a new field:
715      **
716      **      u8 00 00 00 uD =S =D uL uJ<len><ofs> uS 60 00
717      **      (88)(87)(86)(85)(84)(83)(82)(81)(80)(79)(78)(77)(76--75)
718      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
719      **
720      **
721      **      30 00 u0 00 uM u8 00 00 00 uD =S =D uL uJ
722      **      (93--92)(91--90)(89)(88)(87)(86)(85)(84)(83)(82)(81)(80)
723      **
724      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
725      **
726      **
727      ** The "A" is the first output symbol in an output field, so a
728      ** backward search is initiated to find the pending delimiter
729      ** at (84). Since there are pending fields to execute, (84)
730      ** is replaced with a uRESPT token, and execution begins:
731      **
732      **          V
733      **      30 00 u0 00 uM u8 00 00 00 uR =S =D uL uJ
734      **      (93--92)(91--90)(89)(88)(87)(86)(85)(84)(83)(82)(81)(80)
735      **
736      ** The execution routine writes several storage fields below
737      ** token (93), adjusts AvMemEnd to protect them, sends out a
738      ** pIMXQT poll, and then executes the pending tokens. Tokens
739      ** (56) through (84) are executed; token (84) causes the parse
740      ** routines to be invoked again, starting at the last token
741      ** which was parsed, the "A". The execution anchor is set at
742      ** token (84), the location where execution will start again.
743      **
744      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
745      **
746      ** As the first output symbol in an output field, the "A"
747      ** causes a backward search to fill in the delimiter token at
748      ** (84):
749      **
750      **          V
751      **      30 00 u0 00 uM u8 00 00 00 uA =S =D uL uJ
752      **      (93--92)(91--90)(89)(88)(87)(86)(85)(84)(83)(82)(81)(80)
753      **
754      ** Simultaneously, the multiplier at (89) is closed, and the
755      ** parsed symbol is written out:
756      **
757      **          V
758      **      uB =A 30 00 30 00 uM u8 00 00 00 uA =S =D
759      **      (95)(94)(93--92)(91--90)(89)(88)(87)(86)(85)(84)(83)(82)

```

```

760      **
761      **
762      ** The delimiter closes the current field, causing the symbol
763      ** counters at (88) and (86) to be filled (this is done for
764      ** string fields, as well as numeric fields; it doesn't hurt,
765      ** and might be handy for some applications).
766      **
767      **          uB =A 30 00 30 00 uM 30 00 30 00 uA =S =D
768      **          (95)(94)(93--92)(91--90)(89)(88)(87)(86)(85)(84)(83)(82)
769      **
770      ** The comma also opens a new field:
771      **
772      **          u8 00 00 00 uD uB =A 30 00 30 00 uM 30 00
773      **          (100)(99)(98)(97)(96)(95)(94)(93--92)(91--90)(89)(88)(87)
774      **
775      **          #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
776      **
777      **
778      ** This is an unrecognized symbol (cannot start a field).
779      ** First, the parse routine assumes a new delimiter has been
780      ** found; but in doing so, it finds that a delimiter has just
781      ** been opened anyway. So the BldIMG pointer is moved back 5
782      ** bytes to (95), to save RAM.
783      **
784      **          uB =A 30 00 30 00 uM 30 00 30 00
785      **          (95)(94)(93--92)(91--90)(89)(88)(87)(86)(85)
786      **
787      ** Now, any unrecognized symbol causes a pIMCHR poll. The
788      ** MATH ROM, if present, will recognize "C(" as the first
789      ** symbol in an output field, and will insert the following
790      ** tokens:
791      **
792      **          uR uC 00 uB =A 30 00 30 00 uM 30 00 30 00
793      **          (98)(97)(96)(95)(94)(93--92)(91--90)(89)(88)(87)(86)(85)
794      **
795      ** Token (96) is a flag that says (in this case=00) "the
796      ** complex field does not have a multiplier". If it did have
797      ** a multiplier, the value of this byte would be nonzero
798      ** (=01).
799      **
800      ** The MATH ROM causes IMAGE execution to start on the pending
801      ** fields.
802      **
803      ** The execution routine writes several storage fields below
804      ** token (98), adjusts AvMemEnd to protect them, sends out a
805      ** pIMXQT poll, and then executes the pending tokens. Tokens
806      ** (84) through (98) are executed; token (98) causes the parse
807      ** routines to be invoked again, starting at the last token
808      ** which was parsed, the "C". The execution anchor is set at
809      ** token (98), the location where execution will start again.
810      **
811      **          #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
812      **
813      **
814      ** Again, the unrecognized character causes a pIMCHR poll.

```

```

815      ** The MATH ROM, this time, seeing that it has already
816      ** intercepted this poll once (tokens (96)-(98) wouldn't be
817      ** there otherwise), changes the tokens as follows:
818      **      V
819      **      uK uC 00 uB =A 30 00 30 00 uM 30 00 30 00
820      **      (98)(97)(96)(95)(94)(93--92)(91--90)(89)(88)(87)(86)(85)
821      **
822      ** Token (98) will cause a poll during backward search when
823      ** the closing complex parenthesis is found. After handling
824      ** this pIMCHR poll, the MATH ROM causes the image parser to
825      ** open a new field, and keep parsing as usual.
826      **
827      **      u8 00 00 00 uD uK uC 00 uB =A 30 00 30
828      **      (103)(102)(101)(100)(99)(98)(97)(96)(95)(94)(93--92)(91-
829      **
830      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
831      **
832      **
833      **      20 00 u0 00 uM u8 00 00 00 uD uK
834      **      (108--107)(106--105)(104)(103)(102)(101)(100)(99)(98)
835      **
836      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
837      **
838      **
839      **      u8 00 00 00 uD 20 00 u0 00 uM u8
840      **      (113)(112)(111)(110)(109)(108--107)(106--105)(104)(103)
841      **
842      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
843      **
844      **
845      ** This is a leading sign symbol, and does not cause the field
846      ** delimiter to be adjusted (only a "D", "Z" or "*" can do
847      ** that).
848      **
849      **      =M u8 00 00 00 uD 20 00 u0 00 uM
850      **      (114)(113)(112)(111)(110)(109)(108--107)(106--105)(104)
851      **
852      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
853      **
854      **
855      ** This is the first output character in an output field. It
856      ** initiates a backward search for the field delimiter at
857      ** (109). Initializing this field causes a pIMcp1 poll (since
858      ** the MATH ROM had set S7=1 earlier; it wants to know when a
859      ** numeric field is initialized inside a complex field). The
860      ** MATH ROM checks to make sure that no more than 2 numeric
861      ** fields have been specified, and also clears the status bit
862      ** (S3=0) to inhibit execution of the pending fields; the
863      ** complex field must be completely closed before this is
864      ** allowed. So the backward search merely re-writes token
865      ** (109), and continues parsing:
866      **      V
867      **      =Z =M u8 00 00 00 uD 20 00 u0 00
868      **      (115)(114)(113)(112)(111)(110)(109)(108--107)(106--105)
869      **

```

```

870      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
871      **
872      **
873      **      The radix, initiating a backward search, causes the
874      **      counter fields to be filled in with the number of digits
875      **      before the radix:
876      **
877      **              V          V
878      **      =.  =Z  =M  10  00  10  00  uU  20  00  u0
879      **      (116)(115)(114)(113)(112)(111)(110)(109)(108--107)(106-
880      **
881      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
882      **
883      **
884      **      Remember, a "D" after a radix behaves like a "Z":
885      **
886      **              =Z  =.  =Z  =M  10  00  10  00  uU  20  00
887      **      (117)(116)(115)(114)(113)(112)(111)(110)(109)(108--107)
888      **
889      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
890      **
891      **
892      **      The "E" signals the end of digit symbols, so it initiates a
893      **      backward search to fill in the total number of digits in
894      **      the field. It also changes the type of field to uNUMEs
895      **      (numeric, with exponent, with sign):
896      **
897      **              =Z  =.  =Z  =M  20  00  10  00  uT  20  00
898      **      (117)(116)(115)(114)(113)(112)(111)(110)(109)(108--107)
899      **
900      **      And an "E" causes digit output as if the symbols "ESZZZ"
901      **      were being executed:
902      **
903      **              =Z  =Z  =Z  =S  =E  =Z  =.  =Z  =M  20  00
904      **      (122)(121)(120)(119)(118)(117)(116)(115)(114)(113)(112)
905      **
906      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
907      **
908      **
909      **      The closing parenthesis causes a backward search to find
910      **      the nearest open parenthesis, which is at (106). (106) is
911      **      closed by copying the loop counter at (108--107). A
912      **      5-nibble offset to the location of the left parenthesis,
913      **      shown as "<ptr>", is written to the token stream.
914      **
915      **              =Z  =M  20  00  10  00  uT  20  00  20  00
916      **      (115)(114)(113)(112)(111)(110)(109)(108--107)(106--105)
917      **
918      **              u9<ptr>  uP  =Z  =Z  =Z  =S  =E  =Z  =.  =Z
919      **      (125)(124)(123)(122)(121)(120)(119)(118)(117)(116)(115)
920      **
921      **      The right parenthesis is also a delimiter, so a new field
922      **      is opened:
923      **
924      **              u8  00  00  00  uD  u9<ptr>  uP  =Z  =Z  =Z

```

```

925      **      (130)(129)(128)(127)(126)(125)(124)(123)(122)(121)(120)
926      **
927      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"? "Ds,3A,C(2(MZ.dE)))K)
928      **
929      **
930      **      Since no new characters are written out here, the image
931      **      parser assumes a new field is to open. But it checks and
932      **      finds that a new field has already been opened; to save RAM
933      **      it backs up the BldIMG pointer 5 bytes to (125).
934      **
935      **      u9<ptr> uP =Z =Z =Z
936      **      (125)(124)(123)(122)(121)(120)
937      **
938      **      This new right parenthesis is to close the complex field.
939      **      The backward search will find the uIMbck token at (98), and
940      **      poll (pIMbck). The MATH ROM verifies that 2, and only 2,
941      **      numeric fields were included, checks if the complex field
942      **      has a multiplier (if so, it writes out fields similar to
943      **      (123)-(125)), and changes the tokens as follows:
944      **
945      **      00 20 00 uM u8 00 00 00 uD uX uC 00
946      **      -107)(106--105)(104)(103)(102)(101)(100)(99)(98)(97)(96)
947      **
948      **      and
949      **      uX =) u9<ptr> uP =Z =Z =Z =S =E =Z
950      **      (127)(126)(125)(124)(123)(122)(121)(120)(119)(118)(117)
951      **
952      **      The uIMXCH token at (98) will cause the MATH ROM to display
953      **      a "(" for the complex number, to evaluate the complex
954      **      expression and prepare it for formatting. The uIMXCH token
955      **      at (127) is used simply to display a ")" to close the
956      **      complex field.
957      **
958      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"? "Ds,3A,C(2(MZ.dE)))K)
959      **
960      **
961      **      This closing parenthesis matches the open one at token
962      **      (25). A backward search finds the uOPNM- token, which
963      **      causes two actions: 1) the reference counter at (25) is
964      **      filled in by copying the loop counter at (27--26) and
965      **      adding 1 (since the loop counter has been marked as being
966      **      already decremented), and 2) an offset pointer is entered
967      **      in the token stream to point back to the beginning of this
968      **      parentheses loop.
969      **
970      **      u8 00 00 00 uD 10 00 20 00 uM =Z =. =D
971      **      (32)(31)(30)(29)(28)(27--26)(25--24)(23)(22)(21)(20)
972      **
973      **      u9<ptr> uP uX =) u9<ptr> uP =Z =Z =Z
974      **      (130)(129)(128)(127)(126)(125)(124)(123)(122)(121)(120)
975      **
976      **      In addition, the parenthesis is a delimiter, so a new field
977      **      is opened:
978      **
979      **      u8 00 00 00 uD u9<ptr> uP uX =) u9

```

```

980      **      (135)(134)(133)(132)(131)(130)(129)(128)(127)(126)(125)
981      **
982      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
983      **
984      **
985      **      The "K" is the first output symbol in an output field, so ■
986      **      backward search is initiated to find the pending delimiter
987      **      at (131). Since there are pending fields to execute, (131)
988      **      is replaced with ■ uRESPT token, and execution begins:
989      **
990      **      u8 00 00 00 uH u9<ptr> uP uX =) u9
991      **      (135)(134)(133)(132)(131)(130)(129)(128)(127)(126)(125)
992      **
993      **      The execution routine writes several storage fields below
994      **      token (135), adjusts AvMemEnd to protect them, sends out a
995      **      pIMXQT poll, and then executes the pending tokens. Tokens
996      **      (98) through (135) are executed; token (135) causes the
997      **      parse routines to be invoked again, starting at the last
998      **      token which was parsed, the "K". The execution anchor is
999      **      set at token (135), the location where execution will start
1000     **      again.
1001     **
1002     **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
1003     **
1004     **
1005     **      Again, this is the first output symbol in an output field,
1006     **      so a backward search finds token (131) and replaces it with
1007     **      uHKB^-. The parsed symbol is also written out.
1008     **
1009     **      =K u8 00 00 00 uH u9<ptr> uP uX =)
1010     **      (136)(135)(134)(133)(132)(131)(130)(129)(128)(127)(126)
1011     **
1012     **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K)
1013     **
1014     **
1015     **      This closing parenthesis matches the open one at token (5).
1016     **      A backward search finds the uOPNM- token, which causes two
1017     **      actions: 1) the reference counter at (5) is filled in by
1018     **      copying the loop counter at (7--6) and adding 1 (since the
1019     **      loop counter has been marked ■■ being already decremented),
1020     **      and 2) ■■ offset pointer is entered in the token stream to
1021     **      point back to the beginning of this parentheses loop.
1022     **
1023     **      30 00 30 00 uH 40 00 40 00 uF 30 00 40 00 uH
1024     **      (17--16)(15--14)(13)(12)(11)(10)(9)(8)(7--6)(5--4)(3)
1025     **
1026     **      u9<ptr> uP =K u8 00 00 00 uH u9<ptr>
1027     **      (139)(138)(137)(136)(135)(134)(133)(132)(131)(130)(129)
1028     **
1029     **      In addition, the parenthesis is a delimiter, so a new field
1030     **      is opened:
1031     **
1032     **      u8 00 00 00 uD u9<ptr> uP =K u8 00
1033     **      (144)(143)(142)(1419(140)(139)(138)(137)(136)(135)(134)
1034     **

```

```
1035      **      #4(3Dd.D2(3"Ha!",(723x),"$4D6"?Ds,3A,C(2(MZ.dE)))K) ^
1036      **
1037      **
1038      **      The parse pointer now points to the uIMend byte (placed
1039      **      there before parsing began). Since no new symbols are
1040      **      written out, the parser assumes a new field is about to
1041      **      start. But it checks and finds that a new field was just
1042      **      opened, so the BldIMG pointer is backed up 5 bytes to
1043      **      (139).
1044      **
1045      **      u9<ptr> uP =K u8 00
1046      **      (139)(138)(137)(136)(135)(134)
1047      **
1048      **      Parsing the uIMend byte simply causes the uIMend token to
1049      **      be placed in the BldIMG stream. It also initiates a
1050      **      backward search, looking for an open parenthesis. In this
1051      **      case, there are none; finding the uIMsta token at (1)
1052      **      signals that there are no unmatched parentheses.
1053      **
1054      **      u$ u9<ptr> uP =K u8 00
1055      **      (140)(139)(138)(137)(136)(135)(134)
1056      **
1057      **      Execution then begins as usual. The execution routine
1058      **      writes several storage fields below token (140), adjusts
1059      **      AvMemEnd to protect them, sends out a pIMXQT poll, and then
1060      **      executes the pending tokens. Tokens (135) through (140)
1061      **      are executed; token (140) causes the execution routines to
1062      **      test for the end-of-output list.
1063      **
1064      **      If at end-of-output, the statement is over; before exiting
1065      **      to NXTSTM the BldIMG pointer is positioned to the second
1066      **      token in the stream to test for an ASCII "#". The presence
1067      **      of this symbol suppresses a CR-LF.
1068      **
1069      **      If there are more output items, the BldIMG stream is
1070      **      recycled (the execution anchor is moved back to token (1)),
1071      **      and the tokens are executed for the remaining output items.
1072      **      The parse routines will not be invoked again, since no
1073      **      uRESTP token will be encountered.
1074      **
1075      ****
```

```

1075          EJECT
1076          ****
1077          ****
1078          **
1079          ** Name:(S) pIMCHR - Poll for unrecognized IMAGE char
1080          **
1081          ** Category:  POLL
1082          **
1083          ** Type:      FPOLL
1084          **
1085          ** Purpose:
1086          **      To alert LEX files that an unrecognized character was
1087          **      found while parsing an IMAGE string. If a LEX file
1088          **      doesn't handle it, "Invalid IMAGE" error will result.
1089          **
1090          ** Should poll be "Handled" (return with XM=0)?:
1091          **      Yes.
1092          **
1093          ** Meaning of "Handling" Poll (what does code do if handled?):
1094          **      Unrecognized character was accepted, IMAGE token
1095          **      stream was adjusted (if necessary) to process
1096          **      the character at execution.
1097          **
1098          ** Entry conditions for handler (registers, ST, RAM, etc.):
1099          **      Carry set (fast poll)
1100          **      B[A] = Poll number.
1101          **      HEX mode.
1102          **      P=0.
1103          **      RO(A)=points to current position in BldIMG token
1104          **      stream. If any tokens are to be appended to
1105          **      the stream, they should be added below this
1106          **      point. Pointer goes to D1, usually.
1107          **      RO(9-5)=execution pointer. Next time execution of
1108          **      an IMAGE field starts, it will start here.
1109          **      R1(A)=address of unrecognized character which
1110          **      caused the poll. Pointer goes to D0, usually.
1111          **      R1(9-5)=length of IMAGE string (in nibbles)
1112          **      R1(S)=counter for complex numeric fields
1113          **      R2(A)=counter for digits in numeric field (also
1114          **      for A's in a literal field, but this counter
1115          **      is not used).
1116          **      R3(A)=Program Counter (D0 at entry of USING routine)
1117          **      R3(9-5)=address of start of IMAGE string.
1118          **      See USING routine header for explanation of status
1119          **      bits.
1120          **
1121          ** Normal exit conditions from handler if handled (ST, RAM,
1122          **      registers, etc.):
1123          **      HEX mode.
1124          **      XM=0.
1125          **      D1=points to current position in BldIMG token
1126          **      stream. If tokens have been added, D1 must
1127          **      have been moved; if not, D1 must have been
1128          **      set to the address in RO(A).
1129          **      D(A)= AvMenSt

```

```

1130      **      R1(A)=address of next parse character in IMAGE string.
1131      **      This pointer should be moved past the character
1132      **      which caused the poll.
1133      **      P is used to jump (see NOTE)
1134      **      P = 0: jump to Nxtfld
1135      **      1: jump to CkDlm+ (S3 must=1)
1136      **      2: jump to IMGxq1
1137      **      Other fields in R registers should be untouched,
1138      **      unless the poll handler has specific reasons
1139      **      to change them.
1140      **      Status bits should be untouched, unless the poll
1141      **      handler has specific reasons to change them.
1142      **
1143      ** Normal exit conditions from handler if not handled (ST, RAM,
1144      ** registers, etc.):
1145      **      Carry clear (POLL only).
1146      **      HEX mode.
1147      **      XM=1.
1148      **      R registers untouched.
1149      **      (If not handled by any LEX file, IMAGE routines issue
1150      **      an "Invalid IMAGE" error.)
1151      **
1152      ** Available subroutine levels:
1153      **      5
1154      **
1155      ** NOTE:
1156      **      IMAGE parsing and execution are very involved.
1157      **      Study the USING routine header and pIMbck, pIMcpi,
1158      **      pIMXCH and pIMXQT poll documentation to learn
1159      **      more about the process. The USING routine header
1160      **      describes the meaning and values of the IMAGE
1161      **      tokens.
1162      **
1163      **      The IMAGE string and BldIMG token stream is kept
1164      **      in available memory, below AvMemEnd. The BldIMG
1165      **      token stream is built backwards (toward address 0)
1166      **      from the boundary of the IMAGE string:
1167      **
1168      **      BldIMG tokens      IMAGE string      AvMemEnd
1169      **      -----
1170      **      |                  |      ?      |
1171      **      -----
1172      **      ^                  ^ \
1173      **      |                  | unrecognized char
1174      **      pointer in R0(A)    pointer in R1(A)
1175      **
1176      **      Just because a character was encountered that your
1177      **      LEX file will accept, don't accept it blindly.
1178      **      For instance, don't accept a digit specifier in a
1179      **      literal field. For cases like this, you have to
1180      **      back up through the BldIMG tokens to the field
1181      **      delimiter to see what type of field is being
1182      **      processed. If the syntax of the new character
1183      **      doesn't meet your requirements, let the poll go
1184      **      on with XM=1 ("not handled").

```

```
1185      **
1186      **
1187      ** Any strange characters put into the BldIMG stream
1188      ** by a poll handler which require special processing
1189      ** should be preceded by a uIMXCH token to alert the
1190      ** IMAGE execution routines that the poll handler will
1191      ** execute it. Similarly, any strange characters
1192      ** which will adversely affect the backward searching
1193      ** during parse should be "protected" by a uIMPst token
1194      ** (which jumps over 14 nibbles), or a uIMbck token
1195      ** (which causes a pIMbck poll so that the poll handler
1196      ** can do the backup). Backward searching during parse
1197      ** is performed for two reasons:
1198      **      1) to search for an open parenthesis (either to
1199      **         match a closing paren, or at the end of the
1200      **         IMAGE string to verify no unmatched parens).
1201      **      2) to search for delimiter (to initialize an out-
1202      **         put field, or to fill in the number of digits
1203      **         in a numeric field).
1204      **
1205      ** See the pIMbck poll documentation for appropriate
1206      ** use of the uIMbck token. See the pIMXCH poll docu-
1207      ** mentation for examples of "protecting" the tokens.
1208      **
1209      ** Upon return from the pIMCHR poll, the poll handler
1210      ** can select three locations to jump to:
1211      **      Nxtfld -- This routine initializes a new field,
1212      **                and will accept only the normal start-of-
1213      **                field characters (such as D,X,Z,A,S,etc.)
1214      **                If a normal start-of-field character is not
1215      **                found, another pIMCHR poll will be issued.
1216      **                Nxtfld should be used if the unrecognized
1217      **                character is, say, a new type of digit
1218      **                specifier, a new editing symbol, or a new
1219      **                delimiter. However, if the new character
1220      **                initiates an output field, you should jump
1221      **                to IMGxq1.
1222      **      CkDlm+ -- This routine checks for editing
1223      **                characters, then accepts only a standard
1224      **                delimiter (comma, "/", "@", etc.). If a
1225      **                delimiter is not found, another pIMCHR poll
1226      **                will be issued. In order to jump to CkDlm+,
1227      **                S3 must be set=1 ! CkDlm+ should be used
1228      **                if the unrecognized character, say, termin-
1229      **                ates a field, or describes an entire non-
1230      **                output field (such as a new symbol which
1231      **                sounds the beeper).
1232      **      IMGxq1 -- This routine executes all pending
1233      **                IMAGE fields. This should be done any time
1234      **                a new output field is initiated. If the
1235      **                unrecognized character initiates a new out-
1236      **                put field, a uRESTP (restart IMAGE parse)
1237      **                token should be written into the BldIMG
1238      **                stream, and execution begun by jumping to
1239      **                IMGxq1. A good example is the complex
1239      **                field, which intercepts the pIMCHR poll
```

```

1240      **          and causes a jump to IMGxq1 upon return.
1241      **
1242      ** What registers/RAM may be used if handled?:
1243      **      A,B,C,D,DO,D1,P
1244      **      R registers only to adjust values for specific reasons
1245      **
1246      ** What registers/RAM may be used if not handled?:
1247      **      A,B,C, D[15-5], DO, D1, P
1248      **      Don't change AvMEME pointer, or write to available
1249      **      memory below AvMemEnd.
1250      **
1251      ** Special memory/pointer considerations (are pointers funny?):
1252      **      The IMAGE string is stored just below AvMemEnd. The
1253      **      BldIMG token stream is stored below that. All this
1254      **      resides in available memory, so it is volatile (in the
1255      **      sense that someone can inadvertently write over it, if
1256      **      they aren't careful).
1257      **
1258      ** Envisioned application(s):
1259      **      Well....
1260      **      1) Complex IMAGE fields
1261      **      2) A symbol which causes a one-time parsing of
1262      **          the IMAGE string (and stores it in an I/O buffer)
1263      **          for subsequent execution. This would be much
1264      **          faster than parsing it each time.
1265      **      3) Allowing the "%" symbol to generate digit output.
1266      **      4) Specifying the "!" symbol, say, to generate a
1267      **          beep during IMAGE execution.
1268      **      5) Using square brackets to allow multiple-character
1269      **          replication. E.g., "5[3DC]" would be equivalent
1270      **          to "3DC3DC3DC3DC3DC"
1271      **      6) ... and so on ...
1272      **
1273      ** History:

```

```
1281          EJECT
1282          ****
1283          ****
1284          **
1285          ** Name:(S) pIMbck - Backward search, IMAGE parse
1286          **
1287          ** Category: POLL
1288          **
1289          ** Type: FPOLL
1290          **
1291          ** Purpose:
1292          ** Allow LEX files to handle unknown tokens while
1293          ** performing backward search during IMAGE parse.
1294          **
1295          ** Should poll be "Handled" (return with XM=0)?:
1296          ** Yes.
1297          **
1298          ** Meaning of "Handling" Poll (what does code do if handled?):
1299          ** Backward search over unknown tokens was performed
1300          ** properly. One of two actions was performed:
1301          ** 1) unknown field was closed
1302          ** 2) unknown field was verified to be closed
1303          ** during final parentheses match.
1304          **
1305          ** Entry conditions for handler (registers, ST, RAM, etc.):
1306          ** Carry set.
1307          ** B[A] = Poll number.
1308          ** HEX mode.
1309          ** P=0.
1310          ** R1(A)=address of symbol which caused backward
1311          ** search (either a right parenthesis, or the
1312          ** end-of-image).
1313          ** R2(A)=address (in BldIMG stream) of the uIMbck
1314          ** token which caused the poll.
1315          **
1316          ** R0(A)=current position in BldIMG token stream.
1317          ** Next token to be entered must be written below
1318          ** this address.
1319          ** R0(9-5)=address to start next IMAGE execution
1320          ** R1(9-5)=length of IMAGE string (#nibbles)
1321          ** R1(S)=counter for 2 complex numeric fields.
1322          ** R3(A)=Program Counter
1323          ** R3(9-5)=address of start of IMAGE string.
1324          **
1325          ** Normal exit conditions from handler if handled (ST, RAM,
1326          ** registers, etc.):
1327          ** HEX mode.
1328          ** XM=0.
1329          ** D(A)=AvMemSt
1330          ** D1=current position in BldIMG (taken from R0(A),
1331          ** adjusted if necessary)
1332          ** Other R register fields unchanged
1333          ** See NOTE below for changes to BldIMG stream.
1334          **
1335          ** Normal exit conditions from handler if not handled (ST, RAM,
```

```

1336      ** registers, etc.):
1337      **     HEX mode.
1338      **     XM=1.
1339      **     R registers untouched.
1340      **     BldIMG token stream untouched.
1341      **     If not handled by any LEX file, IMAGE routines will
1342      **     issued an "Invalid IMAGE" error.
1343      **
1344      ** Available subroutine levels:
1345      **     4
1346      **
1347      ** NOTE:
1348      **     The pIMbck poll is issued only when a uIMbck token
1349      **     is encountered during backward search in IMAGE parse.
1350      **     The only way a uIMbck token could have been entered
1351      **     into the token stream is for a LEX file to have in-
1352      **     serted it during a pIMCHR poll.
1353      **
1354      **     Backward searching during IMAGE parse is performed
1355      **     for two reasons:
1356      **         1) To search for an open parenthesis: either to
1357      **            match a closing parenthesis (S5=0), or at the
1358      **            end-of-image to verify no unmatched parentheses
1359      **            (S5=1). Use S5 to distinguish the two cases.
1360      **         2) To search for a field delimiter: to initiate
1361      **            an output field, or to fill in the number of
1362      **            digits in a numeric field.
1363      **     The pIMbck poll is issued only for case number 1 !!
1364      **     (The uIMbck token is ignored during backward search
1365      **     for a delimiter.)
1366      **
1367      **     This poll can be used by any new IMAGE syntax which
1368      **     uses parentheses to enclose a field (such as complex
1369      **     fields), or by an application which needs to know
1370      **     when the end-of-image has occurred (whether to check
1371      **     its own tokenization, or whatever).
1372      **
1373      **     Once this poll is issued, the backward search term-
1374      **     inates -- if handled, parsing continues at the point
1375      **     where the backward search was caused; if not handled
1376      **     by any LEX file, "Invalid IMAGE" is reported.
1377      **     Typically, a LEX file would expect to handle this
1378      **     poll only once -- to close the pending field (such
1379      **     as to close a complex field), or, failing to close
1380      **     it, to trap the error ("field not closed", such as
1381      **     unmatched parentheses) at end-of-image. When it is
1382      **     handled properly (i.e., when the pending field is
1383      **     closed), the uIMbck token should be overwritten with
1384      **     another token so that the pIMbck poll is not issued
1385      **     again. For instance, the MATH ROM, when handling the
1386      **     pIMCHR poll for a complex field, inserts the following
1387      **     tokens in the BldIMG stream:
1388      **         uI uC u? ...(existing BldIMG tokens)
1389      **         (3) (2) (1)
1390      **
1391      **     where

```

```
1391      **          uI =uIMbck token
1392      **          uC =uCPLXC token
1393      **          u? =flag to indicate whether multiplied field.
1394      **          uX =uIMXCH token (below)
1395      **          Later, when the closing parenthesis is found to close
1396      **          the complex field, the backward search will poll at
1397      **          token (3). The MATH ROM will overwrite this token
1398      **          with a uIMXCH:
1399      **          uX uC u? ...(existing BldIMG tokens)
1400      **          (3) (2) (1)
1401      **          Since the complex field was properly closed, a pIMbck
1402      **          poll need not be issued again. Note that if the
1403      **          closing parenthesis had not been found, the pIMbck
1404      **          token would still be there at end-of-image. End-of-
1405      **          image also performs a backward search to detect un-
1406      **          matched parentheses; during this pIMbck poll, the MATH
1407      **          ROM would find S5=1, issuing an "Invalid IMAGE" error.
1408      **
1409      **          If an application handles the poll and wishes the
1410      **          backward search to continue, it should either perform
1411      **          its own backward search (see "BACK2(" routine), or
1412      **          "erase" its uIMbck token from the BldIMG stream and
1413      **          reposition D1 and D0 so that the backward search
1414      **          is performed once again by the IMAGE routines. That
1415      **          is, subtract 2 from R1(A) (so that it will point to
1416      **          the symbol which causes the backward search), and
1417      **          restore D1 from R0(A) (the current position in the
1418      **          BldIMG stream). Or if the poll handler wants to be
1419      **          polled more than once, it can, each time, move its
1420      **          uIMbck token out the search area (write it below the
1421      **          current BldIMG address), and reposition D1 and D0
1422      **          ■ above to regenerate the backward search.
1423      **
1424      **          What registers/RAM may be used if handled?:
1425      **          A,B,C,D,D0,D1,P,R0(A),R2,R4
1426      **          Other fields in R registers may be adjusted ■s
1427      **          necessary.
1428      **          BldIMG tokens may be adjusted as necessary.
1429      **
1430      **          What registers/RAM may be used if not handled?:
1431      **          A,B,C,D[15-5],D0,D1,P,R4
1432      **          Do not write below AvMemEnd (contains BldIMG tokens)
1433      **
1434      **          Special memory/pointer considerations (are pointers funny?):
1435      **          The BldIMG stream resides in AvMem, below AvMemEnd.
1436      **
1437      **          Envisioned application(s):
1438      **          1) The MATH ROM uses the pIMbck poll to close complex
1439      **          image fields. At that time, it checks whether
1440      **          2 (and only 2) numeric fields were included, and
1441      **          whether the field had a multiplier. It also
1442      **          generates a uIMXCH token to execute the complex
1443      **          field, and another one to output a right paren-
1444      **          thesis.
1445      **          2) Say ■ LEX file implements an IMAGE symbol "="
```

```

1446      **      which causes pre-parsing of the image string
1447      **      (storing the tokens in an I/O buffer).  The
1448      **      syntax might be that it must be the first char-
1449      **      acter in the image string (even before a "#").
1450      **      A pIMCHR poll would be issued for the "="; the
1451      **      poll handler would insert a uIMbck token as the
1452      **      first token in BldIMG stream.  When the poll
1453      **      handler intercepts the pIMbck poll with S5=1,
1454      **      it would know that the entire image string had
1455      **      been parsed, and was ready to store away.
1456      **

1509          ** HEX mode.
1510          ** P=0
1511          ** XM=0.
1512          ** R2(B)=symbol which caused initialization (must be
1513          ** in upper case; fetched from address in R1(A))
1514          ** B(X)=contents of R2(X) from entry to poll handler
1515          ** D1=current position in BldIMG stream (from R0(A))
1516          ** S4=0 ("do not execute yet")
1517          ** D(A)=AvMemSt
1518          **
1519          ** Normal exit conditions from handler if not handled (ST, RAM,

```

```
1520      ** registers, etc.):
1521      **     HEX mode.
1522      **     XM=1.
1523      **     R registers untouched.
1524      **
1525      ** Available subroutine levels:
1526      **     4
1527      **
1528      ** NOTE:
1529      **     This is a specialized poll for the MATH ROM to handle
1530      **     complex image fields. With some creative coding, the
1531      **     pIMcpi poll can be used by other LEX files.
1532      **
1533      **     The pIMcpi poll is only issued if S7=1 ("complex field
1534      **     being parsed") during image parse; and only when a
1535      **     new output field is being initialized in the BldIMG
1536      **     token stream.
1537      **
1538      **     There are two classes of poll handlers for pIMcpi.
1539      **     1) MATH ROM -- used to process numeric fields
1540      **        in a complex field.
1541      **        In a previous pIMCHR poll (issued at the "C("
1542      **        symbol), the poll handler must have:
1543      **        a) set S7=1
1544      **        b) set R1(S)=2
1545      **
1546      **     2) Other LEX files desiring to detect the init-
1547      **        ialization of any field.
1548      **        In a previous pIMCHR poll (issued at the
1549      **        point a new unrecognized symbol was found),
1550      **        the poll handler must have:
1551      **        a) set S7=1
1552      **        b) set R1(S)=0 (the MATH ROM will still
1553      **           intercept the pIMcpi poll, but if R1(S)
1554      **           is=0, it will exit "not handled")
1555      **        c) S7 must be set=0 before execution of the
1556      **           IMAGE tokens begins. (S7=1 during execu-
1557      **           tion will always invoke the MATH ROM;
1558      **           see pIMcpw poll documentation.)
1559      **
1560      **     Note that the pIMcpi poll was designed as a special
1561      **     poll for the MATH ROM. Its use by any other ROM
1562      **     will conflict with complex fields. In particular,
1563      **     a new symbol can use this poll as long as it and
1564      **     complex fields are syntactically mutually exclusive.
1565      **     -- If S7 has been set=1 by another LEX file
1566      **        then the MATH ROM will not handle the pIMCHR
1567      **        poll for a subsequent "C(" symbol. In other
1568      **        words, setting S7=1 will cause an "Invalid
1569      **        IMAGE" when a complex field is found.
1570      **     -- Any application handling this poll cannot
1571      **        allow its new symbol within a complex field,
1572      **        since the MATH ROM, if it intercepts the poll
1573      **        first, will try to process it. The counter
1574      **        in R1(S) will cause a conflict.
```

```

1575      **
1576      **      (Notwithstanding the above rule, there is probably
1577      **      a way for a pIMcpi poll handler to manage the use
1578      **      of R1(S) to allow complex fields within its own
1579      **      new field. See the MATH ROM code for complete
1580      **      details.)
1581      **
1582      **      What registers/RAM may be used if handled?:
1583      **      A,B,C,D,DO,D1,P,R4,S4,S7
1584      **      R registers may be adjusted as necessary
1585      **      Tokens in BldIMG stream adjusted as necessary
1586      **
1587      **      What registers/RAM may be used if not handled?:
1588      **      A,B,C,D[15-5],DO,D1,P,R4
1589      **      Other R registers untouched
1590      **      Don't write to AvMem below AvMemEnd (stores BldIMG)
1591      **
1592      **      Special memory/pointer considerations (are pointers funny?):
1593      **      BldIMG tokens are stored in AvMem below BldIMG.
1594      **
1595      **      Envisioned application(s):
1596      **      1) MATH ROM uses pIMcpi poll to process complex image
1597      **      fields. Checks that field is numeric, verifies
1598      **      that no more than 2 numeric fields are within the
1599      **      complex field.
1600      **      2) Say a LEX file implements a numeric field descrip-
1601      **      tor which encloses negative numbers in parentheses.
1602      **      The syntax might be, say, "-DDD.D", where a leading
1603      **      "-" would identify this type of descriptor. E.g.,
1604      **      DISP USING "-3D.2D"; -36.25
1605      **      displays "( 36.25)".
1606      **      It would cause a pIMCHR poll for the "-" symbol.
1607      **      At that time, the LEX file could set S7=1, R1(S)=0.
1608      **      When the numeric field is initialized, the pIMcpi
1609      **      poll should be handled to 1) check to make sure
1610      **      it is a numeric field, 2) put appropriate execution
1611      **      tokens in the BldIMG stream to effect the right
1612      **      output, and 3) set S7=0. Note that this new de-
1613      **      scriptor would not be allowed with complex fields,
1614      **      either imbedded inside them, or vice versa (unless
1615      **      some very creative code was written).
1616      **

Digit?
No.
Yes. First digit?
No.
Set "multiplier pending" flag.

Reads:
LC(10) xx00xx0000
 / /
uMULT /
 uOPNWM

Write mult token to BldIMG.

Clear upper C(M).
Read existing multiplier
(mult=0 at first)
C(4)=0 since uOPNWM=E0.
Overflow? (max= 9999) (C(3)#0?)
Yes.

x10. (C(4)=0 since passed test).
Copy new digit.
Write out current multiplier.
(BET) Check next char for digit.

Imbedded space in multiplier?
Yes. Check for more digits.
Multiplier pending?
No.
Yes. Copy mult, test for 0 or 1.
(C(4)=0 since uOPNWM=E0.)
Zero?
Yes.

No. 1?
No. Valid multiplier.
Yes. Cancel multiplier.
Restore D1 before multiplier.
Table address-3.
Restore return address.

Read mask to C(3-0).
Mask to C(4-1).
Copy table, flags to B.
Point to Image table.

Read Image char.
To next table char.
Char allowed in mask?
No.

3039          **
3040          ** NOTE:
3041          **       Whenever a new field begins, a delimiter token
3042          **       (uDELIM) is written to the BldIMG stream, along with
3043          **       two 4-nibble fields used for digit counters. Also,
3044          **       S3 is set=0 to indicate that the field has not yet been
3045          **       initialized (type of field not yet discovered). IMinIt

```

```

3046      **      is called whenever an output character is found; if
3047      **      S3=1, it returns immediately. Otherwise, S3 is set=1,
3048      **      and the BldIMG tokens are scanned (backwards) until
3049      **      the uDELIM token is found. It is then replaced with
3050      **      the appropriate token to identify the type of field.
3051      **
3052      **      However, if pending fields need to be executed (S0=1),
3053      **      the token is replaced with a uRESTP (restart parse)
3054      **      token, and IMGxqt is invoked to execute the fields.
3055      **
3056      **      IMin01 is called to find the field delimiter at certain
3057      **      times, for the following actions:
3058      **      1) when a radix symbol (. or R) is found, one of the
3059      **      4-nibble counter fields is filled with the number
3060      **      of digits before the radix
3061      **      2) when a numeric field ends, the other 4-nibble
3062      **      counter field is filled with the total number of
3063      **      digit symbols.
3064      **      3) when a sign symbol (S or M) is found, the field
3065      **      delimiter is adjusted to indicate that a sign
3066      **      is specified.
3067      **      4) when the E symbol is found, the field delimiter
3068      **      is replaced with one which indicates that the
3069      **      exponent is to be displayed.
3070      **      At these times, S0=0 so that execution will not start.
3071      **
3072      **      Fast poll for pIMcpi may change S0, or the flag in
3073      **      R2(XS) (see C(XS) detail below), if necessary.
3074      **
3075      ** Detail:
3076      **      At entry to IMin01, C(XS) is used as a flag to indicate
3077      **      whether to re-write the delimiter. In cases (1) and
3078      **      (2) above, the field delimiter is not overwritten; in
3079      **      these cases, C(XS) is nonzero as a flag.
3080      **
3081      **      At entry to IMin01, C(B)=new delimiter token to re-
3082      **      write, or C(B)=0 if delimiter merely has to be ad-
3083      **      justed (case (3) above).
3084      **
3085      ** Algorithm:
3086      **      IMin01: Set S2=1 ("count digits")
3087      **      If S3=1, return. ("Field already initialized")
3088      **      Set S3=1, S0=1 ("execute pending fields"),
3089      **      S10=1 ("output field found")
3090      **      Set C(XS)=0 (flag for "re-write delimiter")
3091      **      Save symbol in R2.
3092      **      IMin01: Save D1 in R0.
3093      **      If S7=1 and S0=1, fast poll (pIMcpi)
3094      **      1) Back up through tokens:
3095      **          if uJMPst, then D1+12, go to 1)
3096      **          if uJMPdl, then D1+6, go to 1)
3097      **          if uDELIM, then go to 3)
3098      **          if other delimiter, go to 4)
3099      **          if uRESTP, then go to 2)
3100      **          else go to 1)

```

```

3101      **      2)  Set S0=1 (don't execute)
3102      **      Copy D1 to R0(9-5) (new execution address)
3103      **      3)  Clear R2(A) (digit count)
3104      **      If S0=1, jump to IMGxqt: re-write delimiter
3105      **      with uRESPT token and execute pending fields.
3106      **      If "don't re-write delimiter", go to 5)
3107      **      If "write new token", go to 4)
3108      **      If S9=1 ("sign"), then increment delin+1
3109      **      4)  Re-write delimiter
3110      **      5)  Restore D1 from R0(A).

137      EJECT
138      ****
139      ****
140      **
141      ** Name:(S) pIMXQT - Begin IMAGE execution
142      **
143      ** Category: POLL
144      **
145      ** Type: F POLL
146      **
147      ** Purpose:
148      **     To alert LEX files that IMAGE fields are about to
149      **     begin executing.
150      **
151      ** Should poll be "Handled" (return with XM=0)?:
152      **     No. The IMAGE routines do not check if poll handled.
153      **
154      ** Meaning of "Handling" Poll (what does code do if handled?):
155      **     None.
156      **
157      ** Entry conditions for handler (registers, ST, RAM, etc.):
158      **     Carry set.
159      **     B[A] = Poll number.
160      **     HEX mode.
161      **     P=0.
162      **     R0(9-5)=address of token in BldIMG stream where
163      **     execution is to start.
164      **     R1(A)=address of last character to be parsed in
165      **     IMAGE string.
166      **     R3(A)=Program Counter (original DO as passed to
167      **     the USING routine, updated as expressions are
168      **     executed).
169      **     RAM usage as shown below, in NOTE.
170      **
171      ** Normal exit conditions from handler if handled (ST, RAM,
172      ** registers, etc.):
173      **     HEX mode.
174      **     XM=0.
175      **     See NOTE, below.
176      **
177      ** Normal exit conditions from handler if not handled (ST, RAM,
178      ** registers, etc.):
179      **     HEX mode.
180      **     XM=1.
181      **     See NOTE, below.
182      **
183      ** Available subroutine levels:
184      **     5
185      **
186      ** NOTE:
187      **     IMAGE parsing and execution are very involved.
188      **     Study the USING routine header and pIMbck, pIMcpi,
189      **     pIMXCH and pIMCHR poll documentation to learn
190      **     more about the process. The USING routine header
191      **     describes the meaning and values of the IMAGE
```

```

192      **      tokens.
193      **
194      **      During parsing, the IMAGE string and BldIMG token
195      **      stream is kept in available memory, below AvMemEnd.
196      **      The BldIMG token stream is built backwards (toward
197      **      address 0) from the boundary of the IMAGE string.
198      **      At the time of the pIMXQT poll memory looks like this:
199      **
200      **                                     (Old AvMemEnd)
201      **      -----
202      **      + | BldIMG tokens | IMAGE string |
203      **      ---/-----
204      **      /
205      **      cont'd below      ^           'x' = last character parsed
206      **      xqt address in R0(9-5) points to execution token
207      **
208      **      -----
209      **      | 5 nibs | 3 nibs | 5 nibs | 5 nibs | 5 nibs | BldIMG...
210      **      -----
211      **      ^       ^       ^       ^       ^
212      **      |       |       |       |       | length of IMAGE string
213      **      AvMemEnd | status bits | offset to 'x' above
214      **      |       |       |       |       | offset to start of IMAGE string
215      **      5 zeros (stores offset
216      **      to xqt address when necessary)
217      **
218      **      IMAGE execution begins every time a new output field
219      **      is parsed, or when the end of the IMAGE string is
220      **      found. By the time this poll occurs, all set-up
221      **      for execution has been performed (all pointers and
222      **      offsets have been stored away in AvMem). R1(A)
223      **      contains the address of the IMAGE character which
224      **      caused execution to start (a specifier for a new
225      **      field, or a uIMend token).
226      **
227      **      What the poll handler does with the pIMXQT poll is
228      **      up to it. The mainframe IMAGE execution routines
229      **      should serve for any type of output (DISP USING,
230      **      PRINT USING, OUTPUT USING, etc.), unless some
231      **      LEX file wants to output to some non-standard
232      **      device. If so, it would pick up the IMAGE execution
233      **      at the pIMXQT poll and perform its own execution.
234      **
235      **      The most useful implementation of a pIMXQT poll
236      **      handler is for ENTER USING (found in the HPIL ROM).
237      **      The ENTER USING execution routines are vastly
238      **      different from the output routines, but use the
239      **      same IMAGE token streams. Therefore, the ENTER
240      **      USING code intercepts the pIMXQT poll and performs
241      **      its own execution.
242      **
243      **      How the poll handler returns is also up to it.
244      **      In the case of ENTER USING, the poll handler jumps
245      **      directly back to entry point USGrst (restart parse),
246      **      without exiting through the poll code. A poll

```

```

247      **      handler may exit through the poll code after
248      **      "handling" the poll, but it would want to adjust
249      **      pointers in R0 and possibly in RAM, also.
250      **
251      **      If exiting through USGrst:
252      **      -- RAM pointers, offsets and ST storage unchanged
253      **      -- R3(A)=Program Counter
254      **      -- other R registers unimportant
255      **      If exiting through poll code (XM=0):
256      **      -- RAM pointers, offsets and ST storage unchanged
257      **      -- R3(A)=Program Counter
258      **      -- R0(9-5)=xqt address, pointing to a uRESTP token
259      **
260      **
261      **      What registers/RAM may be used if handled?:
262      **      A,B,C,D,D0,D1,P,R1,R2
263      **      R0 (to adjust address of execution token)
264      **      R3 (to adjust Program Counter)
265      **
266      **      What registers/RAM may be used if not handled?:
267      **      If truly "not handled":
268      **      A,B,C,D[15-5],P,R2
269      **      If handled, but leaving XM=1:
270      **      A,B,C,D[15-5],P,R2
271      **
272      **
273      **      Special memory/pointer considerations (are pointers funny?):
274      **      None. AvMem is available for writing to; this will
275      **      not disturb the IMAGE routines.
276      **
277      **      Envisioned application(s):
278      **      1) ENTER USING routines use the pIMXQT poll to override
279      **      the mainframe output code, instead executing code
280      **      which inputs variables using the BldIMG token stream.
281      **      2) A LEX file may "pre-parse" an IMAGE string (and
282      **      store it in an I/O buffer) for faster execution,
283      **      eliminating the need to parse the IMAGE string
284      **      every time the statement is executed. It could
285      **      invoke the IMAGE parse routines and trap the
286      **      pIMXQT poll before execution starts.
287      **
288      **      History:
289      **
290      **      Date      Programmer      Modification
291      **      -----      -
292      **      12/08/82    MB              Documentation
293      **
294      **      *****
295      **      *****

```

296          EJECT
297          ****
298          ****
299          **
300          ** Name:(S) pIMXCH - Unrecognized symbol in IMAGE execution
301          **
302          ** Category:  POLL
303          **
304          ** Type:      FPOLL
305          **
306          ** Purpose:
307          **    Allow LEX files to execute unrecognized IMAGE tokens.
308          **
309          ** Should poll be "Handled" (return with XM=0)?:
310          **    Yes.  If the poll is not handled by any LEX file,
311          **    the IMAGE routines issue an "Invalid USING" error.
312          **
313          ** Meaning of "Handling" Poll (what does code do if handled?):
314          **    The symbol was executed by a LEX file, generating
315          **    the appropriate output.
316          **
317          ** Entry conditions for handler (registers, ST, RAM, etc.):
318          **    Carry set.
319          **    B[A] = Poll number.
320          **    HEX mode.
321          **    P=0.
322          **    R0(A)=address of uIMXCH token which caused poll.
323          **    If within a numeric field:
324          **        R0(9-5)= counter for #zeroes in field
325          **        R0(S)= flag to identify last numeric symbol:
326          **            0= *
327          **            1= Z
328          **            5= D
329          **    R3(A)=Program Counter
330          **
331          ** Normal exit conditions from handler if handled (ST, RAM,
332          ** registers, etc.):
333          **    HEX mode.
334          **    XM=0.
335          **    R0(A)= address+2 of next token to execute
336          **        in BldIMG stream
337          **    S5=0
338          **    R3(A)=Program Counter
339          **    RAM storage above AvMemEnd untouched.
340          **
341          ** Normal exit conditions from handler if not handled (ST, RAM,
342          ** registers, etc.):
343          **    HEX mode.
344          **    XM=1.
345          **    R0,R3 and RAM storage above AvMemEnd untouched.
346          **
347          ** Available subroutine levels:
348          **    5
349          **
350          ** NOTE:

```

351 ** See NOTE under pIMXQT poll for RAM storage description.
352 **
353 ** The pIMXCh poll is issued only when a uIMXCH token
354 ** is encountered when executing the BldIMG tokens.
355 ** The uIMXCH token can only be placed by a poll handler
356 ** which previously handled a pIMCHR poll; their combined
357 ** purpose is to allow "strange" characters to be parsed
358 ** and executed in a IMAGE string.
359 **
360 ** The uIMXCH token in the BldIMG stream should be
361 ** accompanied by other tokens (or ASCII bytes) which
362 ** the poll handler will use for identification and
363 ** execution.
364 **
365 ** The pIMXCH poll is handled by the MATH ROM when
366 ** executing complex IMAGE fields. The uIMXCH token is
367 ** inserted in the BldIMG stream in two places: 1) at
368 ** start of the complex field, so that the complex exp-
369 ** ression is evaluated, and a left parenthesis is out-
370 ** put, and 2) at the end of the field, to close out the
371 ** field and display a right parenthesis. In the first
372 ** case a special token accompanies the uIMXCH token to
373 ** identify it to the MATH ROM as a complex field. In
374 ** the second case, only an ASCII ")" accompanies the
375 ** uIMXCH token, which is all that is needed to signal
376 ** that the right parenthesis need be displayed.
377 ** For the two cases of complex fields using the
378 ** uIMXCH token, the partial tokenization looks
379 ** like this (it's built backwards towards address
380 ** zero):
381 ** case 1)
382 ** uX uC u? ...(existing BldIMG tokens)
383 ** (3) (2) (1)
384 **
385 ** case 2)
386 ** uX =) ...(existing BldIMG tokens)
387 ** (5) (4)
388 **
389 ** where
390 ** uX = uIMXCH token
391 ** uC = uCPLXC token
392 ** u? = flag byte indicating "multiplied field"
393 ** =) = ASCII ")"
394 **
395 ** The code in the MATH ROM looks for the appropriate
396 ** byte values preceding the uIMXCH token to indicate
397 ** the appropriate action.
398 **
399 ** If a uIMXCH token has been inserted within a numeric
400 ** field, some extra steps have to be taken to insure
401 ** the float-check (for D symbols), and the skip-check
402 ** (for NaNs, Infs and overflows) are performed properly.
403 **
404 ** The float-check is performed to count the number of
405 ** positions that editing symbols or sign symbols must

```

406      **      float over leading zeroes (hence only performed for
407      **      the D fields). The skip-check is performed to count
408      **      the number of positions to fill with spaces (for
409      **      NaN or INF) or *'s (for overflow). If the new symbol
410      **      needs to be counted for either reason, you must
411      **      follow the uIMXCH token with a "D" or "S" or something
412      **      appropriate to cause the count to be incremented.
413      **      This extra "D" or "S" should be protected from the
414      **      execution routine; that is, the uIMXCH poll handler
415      **      should position the execution pointer (passed back
416      **      in RO(A)) past this extra character. On the other
417      **      hand, to make the new symbol terminate either check,
418      **      insert an EndNum token as an extra character.
419      **      Both checks do not poll for uIMXCH; only the token
420      **      executor issues a poll. Thus if the uIMXCH token
421      **      involves pointers which might look like any of the
422      **      symbols
423      **      D S X M . C Z P R uMULT, uSTRPT or a byte>E5
424      **      you will have to protect it with uSTRPT (which
425      **      skips over 14 nibbles) or uMULT (which skips
426      **      over 10 nibbles).
427      **
428      **      For instance, say the new character "I" is allowed
429      **      anywhere in an output field, having the same effect
430      **      as the "parent" symbols (the rest of the symbols
431      **      which define the type of field), except that the
432      **      character in that position is displayed in inverse
433      **      video. For instance, "AAIA" is equivalent to "AAAA",
434      **      except that the third character is displayed in
435      **      inverse video. Similarly, "DDID" is equivalent to
436      **      "DDDD", with an inverse video digit in the third
437      **      position. Since "I" should be counted in the float-
438      **      check and skip-check (since it is allowed in a numeric
439      **      field), the (partial) token stream should look like
440      **      this (it's built backwards towards address 0), using
441      **      using "DDID" as an example:
442      **
443      **      =D =I =D uX =D =D
444      **      (6) (5) (4) (3) (2) (1)
445      **
446      **      where
447      **      =D = ASCII "D"
448      **      =I = ASCII "I"
449      **      uX =uIMXCH token to cause pIMXCH poll.
450      **      Token (3) would be inserted by the poll handler for
451      **      a pIMCHR poll. Then, during execution, the float-
452      **      check routine will count (4), and the pIMXCH poll
453      **      handler will execute (5) when the poll is issued
454      **      at (3). When returning from the pIMXCH poll, the
455      **      execution pointer in RO(A) should be at (6).
456      **
457      **      Now say that the symbol "!<f,d>" causes a beep of
458      **      frequency f, duration d; the new symbol can be
459      **      inserted in any output field. Then "DD!<800,.5>D"
460      **      would be tokenized as follows:

```

```

461      **
462      **          =D uJ p2 p1 uS =! uX =D =D
463      **          (9) (8) (7) (6) (5) (4) (3) (2) (1)
464      **      where
465      **          uJ =uJMPst (jumps 14 nibs on backward search)
466      **          p2 =5 nibble pointer to beep duration
467      **          p1 =5 nibble pointer to beep frequency
468      **          uS =uSTRPT (jumps 14 nibs in float-check)
469      **          uX =uIMXCH token, to cause pIMXCH poll
470      **          =D =ASCII "D"
471      **          =! =ASCII "I"
472      **      Then, during a float-check, (5) will cause a jump
473      **      over the pointers p1 and p2, to token (9); otherwise
474      **      these pointers might be interpreted as executing
475      **      tokens. Token (8) is included for backward
476      **      searching during parse; it causes a jump over
477      **      pointers p1 and p2 for the same reason. Token
478      **      (4) will be executed by the poll handler when the
479      **      pIMXCH poll is issued at (3).
480      **
481      **      What registers/RAM may be used if handled?:
482      **      A,B,C,D,DO,D1,P
483      **      R0 (to adjust pointer or counter)
484      **      R1 (to adjust counter)
485      **      R3 (to adjust Program Counter)
486      **
487      **      What registers/RAM may be used if not handled?:
488      **      A,B,C,D[15-5], DO, D1, P
489      **      R0, R3 untouched.
490      **      RAM storage above AvMemEnd untouched.
491      **      Expression stored in AvMem below AvMemEnd untouched.
492      **
493      **      Special memory/pointer considerations (are pointers funny?):
494      **      If the pIMXCH poll is issued while an output field is
495      **      pending (that is, the expression has already been
496      **      executed, but output not completed), the memory below
497      **      AvMemEnd contains the expression, and may not be
498      **      altered.
499      **
500      **      Envisioned application(s):
501      **      Complex IMAGE fields.
502      **      Some more are listed in NOTE, above.
503      **

513          ****
514          ****
515          **
516          ** Name:(S) pIMcpu - Working on complex image field
517          **
518          ** Category:  POLL
519          **
520          ** Type:      FPOLL
521          **
522          ** Purpose:
523          **      Alert MATH ROM to work on complex field.
524          **
525          ** Should poll be "Handled" (return with XM=0)?:
526          **      No.
527          **
528          ** Meaning of "Handling" Poll (what does code do if handled?):
529          **      Complex expression was evaluated, real or imaginary
530          **      part has been put on stack, ready for formatted out-
531          **      put.
532          **
533          ** Entry conditions for handler (registers, SI, RAM, etc.):
534          **      Carry set.
535          **      B[A] = Poll number.
536          **      HEX mode.
537          **      P=0.
538          **      R0(A)=address of numeric delimiter (in BldIMG token
539          **      stream) which caused the poll.
540          **      R3(A)=Program Counter
541          **
542          **
543          ** Normal exit conditions from handler if handled (SI, RAM,
544          ** registers, etc.):
545          **      This poll can only be handled by the MATH ROM. It
546          **      cannot exit through the poll routines with XM=0;
547          **      it can only exit by jumping to USnm05.
548          **      HEX mode.
549          **      A(W)=numeric expression (either the real or imaginary
550          **      part, as appropriate)
551          **      D1 points to AvMemEnd-16.
552          **      R registers untouched.
553          **
554          ** Normal exit conditions from handler if not handled (SI, RAM,
555          ** registers, etc.):
556          **      HEX mode.
557          **      XM=1.
558          **      R registers untouched.
559          **
560          ** Available subroutine levels:
561          **      7 (junk the two poll levels, and jump to USnm05)
562          **
563          ** NOTE:
564          **      This poll can only be handled by the MATH ROM, ==
565          **      part of complex image field execution.
566          **

```

```
567      ** What registers/RAM may be used if handled?:
568      **      A,B,C,D,D0,D1,P,R0(15-5),R1,R2,R3(9-5),R4
569      **      R0(A) should not be used
570      **      R3(A) should not be used
571      **
572      ** What registers/RAM may be used if not handled?:
573      **      A,B,C,D[15-5],D0,D1,P,R1,R2,R4
574      **
575      ** Special memory/pointer considerations (are pointers funny?):
576      **      At the time of the poll, AvMem is not used to store
577      **      anything. If the poll is handled properly, the
578      **      expression for output resides at AvMemEnd-16.
579      **
580      ** Envisioned application(s):
581      **      MATH ROM complex field output. Only.
582      **

605          **      IMGxqt: P=0
606          **      IMGxq1: D1=current position in BldIMG stream
607          **                  R0(A)=same value as D1
608          **                  R0(9-5)=address to begin executing fields
609          **                  R1(A)=address of last parsed IMAGE symbol
610          **                  R1(9-5)=length of IMAGE string (in nibbles)
611          **                  R3(A)=Program Counter
612          **                  R3(9-5)=Address of start of IMAGE string.
613          **
614          ** Exit:
615          **      Normally exits through USGrst routine.
616          **
617          ** Calls:      IMAGE execution routines call EXPEXC, which can
618          **                  call anything.
619          **
620          ** Uses.....
621          **      Inclusive: IMAGE execution routines call EXPEXC, which can
622          **                  use anything.
623          **
624          ** Stk lvls:   IMAGE execution routines call EXPEXC, which can
625          **                  use all 7 stack levels.
626          **
627          ** NOTE:
628          **      IMGxqt is the standard entry point for executing pend-
629          **      ing output fields in the IMAGE string. Pending output
630          **      fields are executed whenever a new output field is
631          **      encountered; a uRESTP (restart parse) token is inserted
632          **      into the BldIMG stream just before falling into IMGxq1.
633          **
634          **      IMGxq1 is the entry point for executing IMAGE fields.
635          **      The last token to be executed should be either a uRESTP
636          **      (restart parse) token (which halts execution and begins
637          **      parsing where it left off before), or a uIMend (end-of-
638          **      image) token (which tests the output list to see if it
639          **      is exhausted). This entry point is used by the parse
640          **      routines encounter the end of the IMAGE string, and by
641          **      poll handlers for pIMCHR which have detected the start
642          **      of a new output field.
643          **
644          ** Detail:
645          **      When execution starts, a save area is set up at the

1946          ** Purpose:
1947          **      Call EXPEXC for items in IMAGE output list, screen
1948          **      expression for valid type.
1949          **
1950          ** Entry:
1951          **      P      = 0
1952          **      R3(A)=Program Counter
1953          **      RAM storage as shown in IMGxqt header.
1954          **      S3 and S6 determine valid expression types:
1955          **      S6=1 means "numeric expression acceptable"
1956          **      S3=0 means "string expression acceptable"
1957          **      S3#S6 means "complex acceptable"
1958          **      valid type      S3  S6
1959          **      -----
1960          **      numeric          1   1
1961          **      string           0   0
1962          **      complex          1   0
1963          **      any (K or H)     0   1
1964          **
1965          ** Exit:
1966          **      If expression is not of valid type, "Invalid USING".
1967          **      Else:
1968          **          P=0
1969          **          Carry clear
1970          **          S6=0
1971          **          If numeric or complex expression:
1972          **              RES register has been updated
1973          **              A(W)=numeric expression (or =real part, in
1974          **                  the case of complex)
1975          **          If string expression, A(W)=string header except
1976          **              that A(B)=00.
1977          **
1978          ** Calls:      TstEnd, NXTEXP, CKINFO, POPMTH, AVE=D1, GETST1,
1979          **              POPTST, PUTRES
1980          **
1981          ** Uses.....
1982          **      Calls EXPEXC, which may use anything.
1983          **
1984          ** Stk lvls:   Calls EXPEXC, which may use anything.
1985          **              5 levels available to EXPEXC.
1986          **
1987          ** Algorithm:
1988          **      Test output list for end-of-list.  If so, to NXTSTM.
1989          **      Call NXTEXP, which stores status bits and offset
1990          **          to D1 in RAM, jumps to EXPEXC.
1991          **      Pop math stack.
1992          **      Restore status bits from RAM.

```

```

1993      **      If numeric expression:
1994      **      2)      If S6=1, then go to 4). Else go to 3).
1995      **      If string expression:
1996      **      If S3=0, then return. Else go to 3).
1997      **      If complex expression:
1998      **      If S3=0, then go to 2).
1999      **      Else (S3=1) if S6=0 then go to 4).
2000      **      3) Exit to "Invalid USING" error.
2001      **      4) Put expression in RES register. Return.

Argument Count=[0,0]

Save PC

** Name:(S) GDISP\$ - GDISP\$ function execution

** Category: FNEEXEC

** Purpose:

** Implements GDISP\$ function

** Entry:

** P = 0

** D0 is program counter

** D1 is stack pointer

** Exit:

** Exits through EXPR

** Calls: CPYDD-

** Algorithm:

** Save D0 on stack

** Calculate where stack item will start

** If not enough memory then

** Exit with "Insufficient Memory" error

** Write out header for 132 character string

** Copy rightmost display driver (DD) to string

** Copy middle DD to string

** Copy leftmost DD to string

** Point stack pointer to new string

** Restore D0 from stack

** Exit through EXPR

** History:

** Date Programmer Modification

** 10/26/83 B.S. Added documentation

25          STITLE Copy to card
26          *****
27          *****
28          **
29          ** Name:(S) FILCRD - Copy File To Card
30          **
31          ** Category:  FILUTL
32          **
33          ** Purpose:
34          **      Copy file from memory to card.
35          **
36          ** Entry:
37          **      C[A] points to start of file header.
38          **      R1 contains name to be used on card. Zeroes if no
39          **      name specified (use name of file).
40          **      S8=1 if private card requested.
41          **
42          ** Exit:
43          **      Returns if write completed.
44          **      NXTSTM if write aborted.
45          **      Error exits:
46          **
47          ** Calls:      ALIGN, BLANKC, CHKSUM, CMPTIM, CR??, CRDOFF,
48          **      CSLW5, D1+13B, D1+21B, D1+29B, DAYYMD, FNDPRT,
49          **      FROMDT, FTFPF#, IMPFLD, IOAL36, LCTRKS, MAXTRK,

54          **      aslw5, asrw5, crlfnd, csw5, fpoll, idiva,
55          **      noscrl.
56          **
57          ** Uses.....
58          **      A,B,C,D,P,DO,D1,ST,R0-R4,
59          **      SNAPBF, SAVSTK, SCRCH, 8 levels in RSTKBF.
60          **
61          ** Stk lvls:  4
62          **
63          ** Detail:
64          **      Card format chosen for compatibility with HP-75.
65          **      Card is divided into four fields, each preceded by a
66          **      hardware recognized flag and followed by a zero byte.
67          **      Fields are separated by a 66 ttfc (timetrack flux
68          **      change) gap.  fields are as follows:
69          **
70          **      === Start-of-Card: recorded at factory when timetrack
71          **      is recorded.
72          **      SOC marker: "HP" (2)
73          **      format: "CV" (2)
74          **      size: # bytes available after write-protect field
75          **      (specific to Corvallis format) (2)
76          **      for 10" cards: 2BC (=700 base 10)
77          **      (reserved): 0000 (2)
78          **
79          **      === Write-protect: 4-byte field:

```

```

80      **      0000 for write-enabled cards.  \ (2)
81      **      FFFF for write-protected cards. /
82      **      (reserved): 0000 (2)
83      **      padding added by HP-75 (1)
84      **
85      ** ==== Data Header: identifies file, contains security
86      **      information.
87      **
88      **      % identifies fields which differ between HP-71 and
89      **      HP-75 format. HP-75 format is only used
90      **      for LIF1 (text) files.
91      **
92      **      % 0: sub-format (1): 00 for LIF1 file (HP-75 subformat)
93      **      01 for HP-71 files (HP-71 subfmt)
94      **      1: track# (1)
95      **      2: # of tracks in set (1)
96      **      3: # bytes in this track (2)
97      **      5: # bytes in file (2)
98      **      % 7: file type (2): HP-75 filetype (HP-75 subformat)
99      **      LIF filetype (HP-71 subformat)
100     **      9: creation date (4): hex seconds since start of
101     **      century.
102     **      13: file name (8)
103     **      % 21: password (4): blanks for LIF1 filetype (HP-75)
104     **      implementation (4): (HP-71 subformat)
105     **      25: marker (2): checksum of entire file, including
106     **      file header.
107     **      27: partial statement status (1)
108     **      28: s1 (2)
109     **      30: s2 (2)
110     **      32: data checksum (2): 2-byte checksum of data field.
111     **      34: header checksum (1): 2-byte sum of header field,
112     **      folded to one byte without
113     **      wraparound carry.
114     **      35: (reserved) (1)
115     **      padding added by HP-75 (2)
116     **
117     **      File headers for the two subformats differ only in
118     **      bytes 0, 7-8 and 21-24.
119     **
120     ** ==== Data: 650 bytes
121     **
122     **      padding added by HP-75 (3)
123     **
124     **
125     **
126     **      All files except LIF1 will use LIF filetype in the
127     **      filetype. For the curious among you, HP-75
128     **      filetypes consist of two bytes:
129     **
130     **      high order byte: 00=HP-75 system file
131     **      ??=HP-75 text file
132     **      ??=HP-75 basic file
133     **      ??=HP-75 appointment file
134     **      ??=HP-75 lex file

```

```

135      **                               ??=HP-75 keds file
136      **                               "I"=LIF1
137      **
138      **      low order byte: HP-75 attribute byte.  Identifies
139      **      file capabilities.  bit masks as defined by
140      **      HP-75 are:
141      **      80=in rom
142      **      40=file runnable
143      **      20=file editable
144      **      10=file listable
145      **      08=file purgable
146      **      04=file copyable
147      **      02=standard lined file
148      **      01=token file
149      **      two important bit masks are:
150      **      34=private file
151      **      7E=data file for print#/read#
152      **
153      **      HP-75 documentation identifies some basic file
154      **      types:
155      **      0062=calculator file
156      **      0000=system file
157      **      013E=text file
158      **      027E=basic file
159      **      030C=appointment file
160      **      050C=alpd fild
161      **      0008=diagnostic file
162      **
163      **
164      ** -----
165      **
166      **      Function of scratch registers in card write:
167      **      R0=scratch
168      **      R1[A]=file pointer
169      **      R1[9-5]=amount of zero-padding at end of file in bytes
170      **      (used to bring LIF1 to sector boundary).
171      **      R2=pointer to I/Obuffer containing header
172      **
173      **      Function of status bits:
174      **      S1: Used by Verify to suppress DATA ERROR in read from
175      **      FIFO.
176      **      S2: Indicate we are on last track of card set.
177      **
178      **      Algorithm:
179      **      Check for presence of card reader; eDVCNF if absent.
180      **      Allocate I/O buffer for building header; eMEM if
181      **      no room for buffer.
182      **      Fetch filetype from file.  If not copying to PCRD then
183      **      goto 2.
184      **      Search for filetype in filetype table.  If found then
185      **      goto 1.
186      **      If filetype not in standard range then goto 2.
187      **      Set privacy bit in filetype.  Goto 2.
188      **      1: If there are < 3 entries in filetype table for this
189      **      filetype then goto 2.

```

```

190      **      Read third entry (private) from filetype table.
191      **      2: Store filetype in card header I/Obuffer.
192      **      Store passed destfile name in header I/Obuffer.
193      **      Compute time (seconds since start of century) and store
194      **      in header I/Obuffer.
195      **      If we are writing out LIF1 filetype then write HP-75
196      **      LIF1 filetype to filetype field and 00 to subformat
197      **      field, else write 01 to subformat field.
198      **      Write 01 to track# field in header I/Obuffer.
199      **      If copycode=8 then poll for somebody to copy card;
200      **      eFYPE if not handled.
201      **      Compute file length in bytes: (chain length-5)/2 if
202      **      copycode#1, (chain length-13)/2 if copycode = 1;
203      **      rounded up to byte. If > FFFF bytes then eF2BIG.
204      **      If filetype = LIF1 then pad file length up to sector
205      **      boundary (256 bytes).
206      **      Write file length to header I/Obuffer.
207      **      Compute implementation field, write to header
208      **      I/Obuffer.
209      **      Perform checksum of entire file for "marker" byte--byte
210      **      which uniquely identifies card set. Write to
211      **      header I/Obuffer.
212      **      Compute # tracks in card set. Write to header
213      **      I/Obuffer.
214      **      3: Read track# and maxtrack# from header I/Obuffer.
215      **      Deallocate buffer and return if track# > maxtrack#.
216      **      Compute trksize. Write to header I/Obuffer.
217      **      Compute checksum of this track. Write to header
218      **      I/Obuffer.
219      **      Write 0's to partial card recovery fields (since
220      **      recovery is not implemented).
221      **      Compute header checksum. Write to header I/Obuffer.
222      **      Perform WCRD poll.
223      **      4: Prompt "Wrt: Align then ENDLN" and wait for ENDLINE or
224      **      ATTN or f-ATTN or timeout.
225      **      If ATTN or f-ATTN or timeout then abort.
226      **      Prompt "Pull xxx of xxx".
227      **      {card now starts moving.}
228      **      Verify start-of-card (SOC) field. If wrong then
229      **      eUNKCD and goto 4.
230      **      Read write-protect field. If not 0's then ePROTD and
231      **      goto 4.
232      **      Switch to write mode. Write 16 nibbles of 0's.
233      **      Write BREAK to card.
234      **      Write header I/Obuffer to card.
235      **      Write 16 nibbles of 0's to card.
236      **      Write BREAK to card.
237      **      Write data field to card, padding with 0's as necessary
238      **      for text files.
239      **      Turn off card reader.
240      **      5: Prompt "Vfy: Align then ENDLN" and wait for ENDLN.
241      **      Prompt "Pull xxx of xxx".
242      **      Verify SOC field. If fail, eUNKCD and goto 5.
243      **      Skip write-protect field.
244      **      Verify header field. If error, eVFYER and goto 4.

```

```

245      **      Verify data field.  If error, eVfYER and goto 4.
246      **      Turn off card reader.
247      **      Update file pointer and increment track#.  Goto 3.
248      **
249      ** History:

582 **
583 ** Name:(S) pWCRD8 - Poll To Write Copycode ■ File To Card
584 **
585 ** Category: POLL
586 **
587 ** Type: POLL
588 **
589 ** Purpose:
590 ** Allow handler to copy a file with copycode of ■ out to
591 ** card.
592 **
593 ** Should poll be "Handled" (return with XM=0)?:
594 ** Yes, if you do the copy.
595 **
596 ** Meaning of "Handling" Poll (what does code do if handled?):
597 ** The copy has been performed. The WHOLE thing...
598 ** prompting, writing, verifying, etc. The copy code
599 ** will perform a normal exit. If poll is not handled,
600 ** copy code performs an error exit.
601 **
602 ** Entry conditions for handler (registers, ST, RAM, etc.):
603 ** Carry set on entry.
604 ** B[A] = Poll number.
605 ** HEX mode.
606 ** P=0.
607 ** Card header buffer (ID=bCARD) has been allocated and
608 ** set up (as per FILCRD header) with:
609 ** Name
610 ** Filetype
611 ** Creation date
612 ** Subformat and track#.
613 ** R1[A] points at start of file header.
614 ** R2[A] points at card header I/Obuffer (past header).
615 ** A[3-0] contains filetype.
616 **

```

```

617      ** Normal exit conditions from handler if handled (ST, RAM,
618      ** registers, etc.):
619      **     HEX mode.
620      **     XM=0.
621      **
622      ** Normal exit conditions from handler if not handled (ST, RAM,
623      ** registers, etc.):
624      **     HEX mode.
625      **     XM=1.
626      **
627      ** Available subroutine levels:
628      **     5
629      **
630      ** What registers/RAM may be used if handled?:
631      **     A-D, D0, D1, P, R0-R4, all scratch RAM.
632      **
633      ** What registers/RAM may be used if not handled?:
634      **     A-D, D0, D1, P, R0-R4, all scratch RAM.
635      **
636      ** Envisioned application(s):
637      **     Somebody's got to know how to copy out a file with a
638      **     crazy copycode like 8.

1041      **
1042      ** Stk lvls:  1
1043      **
1044      ** Detail:
1045      **      Since partial card recovery was designed but is not
1046      **      being used, this rather simple routine simply fills
1047      **      the appropriate fields with zeroes.  In case partial
1048      **      card recovery is ever used, this is what goes into
1049      **      the partial card recovery fields:
1050      **
1051      **      Partial statement status (pss) field and s1 and s2
1052      **      contain information for recovery of files which were
1053      **      only partially read:
1054      **
1055      **      partial statement status (1):
1056      **      bit#      meaning
1057      **      ----      -
1058      **      0      file unrecoverable(0)/recoverable(1) if
1059      **      not all cards read
1060      **      1      fill(0)/pack(1) out missing tracks
1061      **      2      variable(0)/fixed(1) length records
1062      **      3      zero(0)/one(1)-fill missing tracks
1063      **      (if bit #1 = 0)
1064      **      4
1065      **      5
1066      **      6      add 1 nib to s2
1067      **      7      add 1 nib to s1
1068      **      For files with bit 0 set and bit 2 clear, s1 and s2
1069      **      have the following meaning:
1070      **      s1: size of first partial line (start of data to
1071      **      to end of line): in bytes
1072      **      s2: size of last partial line (start of line to
1073      **      end of data): in bytes
1074      **      For files with bit 0 set and bit 2 set:
1075      **      s1: record size
1076      **      (this is needed for file header and for
1077      **      packing/zeroing missing records)
1078      **
1079      **
1080      ** Algorithm:
1081      **      Zero-fill partial card recovery fields.

1279      **
1280      ** Detail:
1281      **      Uses standard checksum with wraparound carry.
1282      **
1283      ** Algorithm:
1284      **      Clear B for checksum.
1285      **      C[3-0]=#nibs div 16; C[S]=#nibs mod 16.
1286      **      1: If C[3-0]=0 then goto 2.
1287      **      Read 16 nibbles into A at D0.
1288      **      Increment D0 by 16.
1289      **      Add A to B with wraparound carry.
1290      **      Goto 1.
1291      **      2: A=0.
1292      **      Read partial word (C[S] nibbles) into A at D0.

```

```

1293      **      Add A to B with wraparound carry.
1294      **      B[7-0]=B[7-0]+B[15-8] with wraparound carry.
1295      **      A[3-0]=B[3-0]+B[7-4] with wraparound carry.

4453 ** Name:(S) pWCRD - Card Write Poll
4454 **
4455 ** Category: POLL
4456 **
4457 ** Type: FPOLL
4458 **
4459 ** Purpose:
4460 ** Allow processing before writing out a card track.
4461 **
4462 ** Should poll be "Handled" (return with XM=0)?:
4463 ** If polling should terminate, then poll should be
4464 ** handled.
4465 **
4466 ** Meaning of "Handling" Poll (what does code do if handled?):
4467 ** Code does nothing different if poll is handled.
4468 ** Handling merely terminates polling, which is probably
4469 ** the desired result.
4470 **
4471 ** Entry conditions for handler (registers, ST, RAM, etc.):
4472 ** We are about to prompt for a card.
4473 ** Carry set on entry.
4474 ** B[A] = Poll number.
4475 ** HEX mode.
4476 ** P=0.
4477 ** R1-R2 set up as FILCRD documentation explains.
4478 ** The bCARD buffer contains the card header.
4479 **
4480 ** Normal exit conditions from handler if handled (ST, RAM,
4481 ** registers, etc.):
4482 ** HEX mode.
4483 ** XM=0.
4484 ** Card header modified as desired.
4485 **
4486 ** Normal exit conditions from handler if not handled (ST, RAM,
4487 ** registers, etc.):
4488 ** HEX mode.
4489 ** XM=1.
4490 ** Card header modified if desired.
4491 **
4492 ** Available subroutine levels:
4493 ** 2
4494 **
4495 ** NOTE:
4496 ** If you modify the card header, you must recompute the
4497 ** card header checksum, or you will never be able to
4498 ** read back the card you have written.

```

```

4499      **
4500      ** What registers/RAM may be used if handled?:
4501      **      A-D, DO, D1, P, R0, R3, R4, all scratch RAM.
4502      **
4503      ** What registers/RAM may be used if not handled?:
4504      **      A-C, D[5-15], DO, D1, P, R0, R3, R4, all scratch RAM.
4505      **
4506      ** Envisioned application(s):
4507      **      Setting up card header for partial card recovery.
4508      **      It is highly doubtful whether partial card recovery
4509      **      can be done, but this is the hook which allows you to
4510      **      try it. The documentation for FNDPRT explains the
4511      **      meaning of the partial card recovery information
4512      **      fields. Good luck.
4513      **

4525      ** Name:(S) pRCRD - Poll After Reading Card.
4526      **
4527      ** Category: POLL
4528      **
4529      ** Type: F POLL
4530      **
4531      ** Purpose:
4532      **      Poll after each card track is read.
4533      **
4534      ** Should poll be "Handled" (return with XM=0)?:
4535      **      If it is desired to terminate polling, yes.
4536      **
4537      ** Meaning of "Handling" Poll (what does code do if handled?):
4538      **      Code doesn't do anything different if poll is handled.
4539      **      Handling simply stops polling, which may be desirable.
4540      **
4541      ** Entry conditions for handler (registers, ST, RAM, etc.):
4542      **      Carry set on entry.
4543      **      B[A] = Poll number.
4544      **      HEX mode.
4545      **      P=0.
4546      **      R1, R2 as defined in CRDFIL header.
4547      **      bCARD buffer contains header of card just read in.
4548      **      Code has just read a track and is about put up a
4549      **      "trk <nnn> done" message.
4550      **
4551      ** Normal exit conditions from handler if handled (ST, RAM,
4552      ** registers, etc.):
4553      **      HEX mode.

```

```

4554      **      XM=0.
4555      **
4556      ** Normal exit conditions from handler if not handled (ST, RAM,
4557      ** registers, etc.):
4558      **      HEX mode.
4559      **      XM=1.
4560      **
4561      ** Available subroutine levels:
4562      **      3
4563      **
4564      ** What registers/RAM may be used if handled?:
4565      **      A-D, DO, D1, P, RO, R3, R4.
4566      **      All scratch RAM.
4567      **
4568      ** What registers/RAM may be used if not handled?:
4569      **      A-C, C[5-15], DO, D1, P, RO, R3, R4.
4570      **      All scratch RAM.
4571      **
4572      ** Special memory/pointer considerations (are pointers funny?):
4573      **      There is no available memory.
4574      **
4575      ** Envisioned application(s):
4576      **      This is supposed to be the hook to allow partial card
4577      **      recovery. I am skeptical, but I'll keep it to myself.
4578      **      If the card was written by somebody who knows how to
4579      **      do partial card recovery, the header will contain data
4580      **      necessary to perform recovery. This poll is an
4581      **      opportunity to take the data and stuff it somewhere
4582      **      useful. One recovery scheme which worked very well
4583      **      is the past was storing the data in the space to be
4584      **      occupied by adjacent tracks IF the adjacent track has
4585      **      not been read yet. The flaw in this is what happens if
4586      **      that data is munched by an unsuccessful read in the
4587      **      adjacent track. The data is lost. So what to do?
4588      **      Maybe create an I/O buffer to hold the data. Of course
4589      **      that buffer had better be around before the read is
4590      **      initiated, since the read code sucks up all available
4591      **      memory to make room for the biggest card set possible.
4592      **      Good luck.

15 **
16 ** Name:      FTYPE      -      Mainframe File Type Table
17 **
18 ** Category:  FILUTL
19 **
20 ** Purpose:
21 **      This module contains the HP-71 File Type Table which
22 **      defines the file types the HP-71 mainframe recognizes.
23 **      The table starts at address =FTYPE. This module does
24 **      not contain any executable code.
25 **

```

```

26 ** Entry:

```

39 ** Detail:
40 **

```

41 FILE TYPE TABLE FORMAT

42 **	43 **	44 **	45 **
Field	Size (nibs)	Meaning	
46 ** Create code	1	0: Normal mainframe file structure (BASIC, BIN, LEX, KEY, etc) File length measured in nibs, arbitrary format, subheaders allowed	
47 **		1: DATA file structure; up to 65535 fixed length records of up to 65535 bytes each; subheaders not allowed; file is initialized to FF's	

56	**			2: SDATA file structure; records are
57	**			fixed length, 8 bytes each; file
58	**			initialized to zeros; subheaders
59	**			not allowed
60	**			4: TEXT file structure; records are
61	**			variable number of bytes; file
62	**			initialized to FF's; subheaders
63	**			are not allowed
64	**			8: Special handler routine required
65	**			to create this file; system will
66	**			issue pCRT=8 poll
67	**			
68	**	Copy code	1	0: Normal mainframe file structure;
69	**			File can be copied into or out of
70	**			HP-71 without aid from LEX file;
71	**			Implementation Field contains
72	**			file length on external copy,
73	**			but is not present after file
74	**			header when file is in memory
75	**			1: DATA file structure; file can be
76	**			copied into or out of HP-71 with
77	**			no aid from LEX file; on external
78	**			copy, the Implementation Field
79	**			contains number of records and
80	**			record length, and it is present
81	**			immediately after file header
82	**			when file is in memory
83	**			2: SDATA file structure; file can be
84	**			copied into or out of HP-71 with
85	**			no aid from LEX file; on external
86	**			copy, the Implementation Field
87	**			contains number of records, but
88	**			is not present after file header
89	**			when file is in memory
90	**			4: TEXT file structure; file can be
91	**			copied into or out of HP-71 with
92	**			no aid from LEX file; on external
93	**			copy, the Implementation Field is
94	**			zero, and it is not present after
95	**			file header when file is in
96	**			memory
97	**			8: Special copy routine is required
98	**			to copy file to or from HP-71;
99	**			system will issue pWCRD8 poll;
100	**			Implementation Field is present
101	**			after file header when file is
102	**			in memory
103	**			
104	**	Execution code	1	1: File is executable (can be run)
105	**			0: File is not executable
106	**			
107	**	File data offset	2	Offset in nibs from start of file
108	**			chain length field (in file header)
109	**			to start of file data, skipping the
110	**			Implementation Field, if present

```

111      **      after file header (see Copy code,
112      **      above), and also skipping the
113      **      subheader (if any); this value is
114      **      used to calculate the subheader
115      **      length, when present
116      **
117      ** File type name      10      5 character ASCII name of the file
118      **
119      **
120      **
121      ** Number of types      1      Number of file type numbers used
122      **
123      **
124      **
125      **
126      **
127      **
128      **
129      **
130      **
131      **
132      **
133      **
134      **

95      STITLE File Header Equates
96      **=====
97      **
98      **      File Header Equates
99      **
100     ** Detail:
101     **
102     **      File name:
103     **      8 characters, blank filled
104     **
105     **      File type:
106     **      LIF File Type Number of the file. This field ALWAYS
107     **      represents the unprotected form of the file type
108     **
109     **      Flags:
110     **      a) Lower nibble of the flags:
111     **          This nibble is called the protection nibble.
112     **          Bit:   3   2   1   0
113     **                  -----
114     **                  | Un | Un | PV | SE |
115     **                  -----
116     **                      PV - Private
117     **                      SE - Secure
118     **                      Un - Undefined
119     **
120     **      b) Higher nib of the flags:
121     **          File copy code from file type table. Its value
122     **          determines how the file may be accessed:
123     **
124     **          Value      Meaning
125     **          -----
126     **          0      Normal mainframe file structure;
127     **                  File can be copied into or out of
128     **                  HP-71 without aid from LEX file;
129     **                  Implementation Field contains
130     **                  file length on external copy,
131     **                  but is not present after file
132     **                  header when file is in memory
133     **
134     **          1      DATA file structure; file can be
135     **                  copied into or out of HP-71 with
136     **                  no aid from LEX file; on external
137     **                  copy, the Implementation Field
138     **                  contains number of records and
139     **                  record length, and it is present
140     **                  immediately after file header
141     **                  when file is in memory
142     **
143     **          2      SDATA file structure; file can be
144     **                  copied into or out of HP-71 with
145     **                  no aid from LEX file; on external
146     **                  copy, the Implementation Field
147     **                  contains number of records, but
148     **                  is not present after file header
149     **                  when file is in memory

```

```

150      **                no aid from LEX file; on external
151      **                copy, the Implementation Field is
152      **                zero, and it is not present after
153      **                file header when file is in
154      **                memory
155      **
156      **                8    Special copy routine is required
157      **                to copy file to or from HP-71;
158      **                system will issue pWCRD8 poll;
159      **                Implementation Field is present
160      **                after file header when file is
161      **                in memory
162      **
163      **      Time Field:
164      **      Time of creation of file
165      **

208          STITLE File Information Buffer Equates
209          **=====
210          **
211          **          File Information Buffer (FIB) Equates
212          **
213          ** The FIB contains the following information:
214          **
215          ** 1. FIB number (2 nibs) - If 00, end of FIB
216          **
217          ** 2. File buffer number (3 nibs) -
218          **      If (and only if) the file is on an external device,
219          **      it has an I/O buffer associated with it, and this
220          **      field contains the I/O buffer number of the file. If
221          **      this field is 000, the file is in memory and there is
222          **      no I/O buffer associated with it.
223          **
224          ** 3. File type (4 nibs) - LIF file type of the file
225          **      This is the unprotected file type number of the file.
226          **
227          ** 4. File protection nibble (1 nibs) - Copied from the low
228          **      nibble of the file flags field in the file header
229          **      when the file is opened. Subsequent SECURE or
230          **      PRIVATE commands do not alter its value. Original
231          **      value derives from the file type table.
232          **
233          ** 5. File copy code (1 nib) - This is the same nibble as in
234          **      the file header.
235          **
236          ** 6. Access code (1 nib) -
237          **      When set to 1, this field indicates that the contents
238          **      of the file have been modified since the field was
239          **      last cleared. For external files, it is cleared each
240          **      time a new sector is read into the I/O buffer. It is
241          **      set when the contents of the I/O buffer are modified
242          **      so that the I/O buffer can be flushed properly during
243          **      subsequent operations.
244          **
245          ** 7. Device type (1 nib) - This nibble indicates where the
246          **      file is located:
247          **          0 - Mainframe                      1 - Independent RAM
248          **          2 - ROM                            8 - HP-IL device
249          **
250          ** 8. File begin (6 nibs) -
251          **      For file in Memory:
252          **          Nibs      Field
253          **          -----
254          **          4-0      Absolute address of file header start
255          **          5          Unused
256          **      For file on external device:
257          **          Nibs      Field
258          **          -----
259          **          0          Entry number in the directory record
260          **          4-1        Sector number of the directory record
261          **
262          ** 9. Subheader length (2 nibs)

```

```

263      **      This length is the number of bytes of the subheader.
264      **      It is computed as follows:
265      **      a) Take the data offset (in nibs) from the file type
266      **         table and subtract 5 nibbles from it.
267      **      b) If the file type is 1 (fixed length data format)
268      **         subtract another 8 nibbles (implementation field).
269      **      c) Divide by 2 to convert nibbles into bytes.
270      **
271      **      Copy code 1: (data offset-13) / 2
272      **      Copy codes 0,2,4: (data offset -5) / 2
273      **      Copy code 8: Set by poll handler when file opened.
274      **
275      ** 10. File data start (11 nibs) -
276      **      Absolute address of the start of data of the file.
277      **
278      **      For file in RAM/ROM:
279      **      Nibs    Field
280      **      ----    -----
281      **      4-0    Abs addr of data start
282      **                (skip over the subheader)
283      **      6-5    Hex F0
284      **      8-7    Port address: Port #, Extender #
285      **      10-9    Unused
286      **
287      **      For file on an external (HP-IL) device:
288      **      Nibs    Field
289      **      ----    -----
290      **      3-0    Record address of the first record of the
291      **                file. If file has a subheader, it starts
292      **                at byte 00 of this record and is immedia-
293      **                tely followed by data. Otherwise, the
294      **                data starts at byte 00 of this record.
295      **      6-4    Device address
296      **      9-7    Assign code
297      **      10    Assign type
298      **
299      ** 11. Number of Records (4 nibs) -
300      **      For copy code 1 (DATA) files, this is the number of
301      **      records in the file.
302      **
303      ** 12. Record length (4 nibs) -
304      **      For copy code 1 (DATA) files, this is the record
305      **      length in bytes.
306      **
307      ** 13. Current position (6 nibs) -
308      **      This is the current file pointer. It is the offset
309      **      from the file start reference point. Due to the
310      **      sector boundary constraints of HPIL I/O, the file
311      **      start reference point for external files differs
312      **      slightly from that of internal files.
313      **
314      **      Nibs    Field
315      **      ----    -----
316      **      6-5    Not used
317      **      4-0    Offset from file start reference point in
  
```

```

318      **                               nibbles.
319      **                               For internal files:
320      **                               Offset from start of data (that is, sub-
321      **                               header not included)
322      **                               For external files:
323      **                               Offset from start of subheader
324      **
325      ** 14. File data length (6 nibs) -
326      **      This is the file data length not including the
327      **      subheader.
328      **      Nibs      Field
329      **      -----
330      **      5-0      File data length in nibbles.
331      **
332      ** 15. Remaining length in current record (5 nibs) -
333      **      Used by PRINT# and READ# to keep track of the number
334      **      of bytes remaining in the current record for copy
335      **      code 1 (DATA) files.
336      **
337      ** 16. Device size (6 nibs)
338      **      This field applies only for files in an external
339      **      memory device (HP-IL)
340      **      Nibs      Field
341      **      -----
342      **      5-0      Number of sectors allocated to this file.
